Clouded Judgement 12.12.25 - Long Live Systems of Record

JAMIN BALL
DEC 12, 2025

Every week I'll provide updates on the latest trends in cloud software companies. Follow along to stay up to date!

Systems of Record are Dead. Long Live Systems of Record

Every few weeks I see some version of the same claim: "The new system of record is the agent," or "Workflows swallow systems of record," or "Data is the system of rec apps are just thin views." There is a grain of truth in each of those, but I think it is a easy to over-rotate and accidentally throw out the thing enterprises still need most, which is not a "system of record" as much as a reliable source of truth.

When I think about systems of record, I do not actually think in product categories. think in the much more boring lens of "where does the truth live." In other words, i enterprise workflow needs to know something at a specific step, where is the one p that answer is considered canonical. Because as workflows get more automated anc more agent driven, the fragility point often has nothing to do with the model and everything to do with whether the agent pulled the right value from the right syste

Anyone who has spent time inside a large company knows how messy this gets in practice. Take something as simple as "what is our ARR." Ask the sales org and you will get one number. Ask finance and you get another, with a different set of exclusions and adjustments. Ask accounting, now you are talking revenue recogniti not bookings. Ask legal, and they will correctly remind you that half the "ARR" in a fast growing business is backed by contracts that look nothing like the neat recurri subscription you want it to be. Even the definition is slippery. For a consumption business, is ARR the annualized run rate from last month's usage, is it contracted commit, is it contracted commit net of discounts and credits, or is it a lagging twelv month billing number dressed up to sound like a recurring metric.

Now imagine you tell an agent, "Go calculate ARR by segment and send a deck to tl board." Which ARR should it use. Which table is canonical. If sales and finance disagree, who wins. If the billing system and the warehouse have drifted by a few percent, which one does the agent treat as truth. This is the part of the "systems of record are dead" argument that feels off to me. The more we automate, the more important it becomes that someone has done the unglamorous work of deciding wh the correct answer is and where it lives.

Historically, systems of record solved this in a fairly straightforward way. You had a CRM system of record for customers and opportunities, an ERP for financials, an HRIS for people, a billing system for invoices, and so on. They were not perfect, but each domain had a primary home. Then the last decade arrived and everyone tried t centralize that reality into the warehouse or lakehouse. The pitch was that if you poured all the data into one place and layered semantic models and metrics definiti on top, you would finally get a single source of truth that analytics, dashboards and downstream tools could all agree on.

curated gold tables that fed BI tools. The problem is that most of this lived downstream of the operational world. The sales team still lived in Salesforce, the finance team still closed the books in NetSuite, the support team still worked ticket in Zendesk. The warehouse or lakehouse was the retrospective mirror, not the transactional front door.

Agents change that equation in two important ways. First, they are inherently cross system. When you tell an agent to “run a quote to cash workflow,” you are asking it dance across CRM, CPQ, billing, collections, and maybe a few internal tools that liv in random corners of the org. Second, they are inherently action oriented. This is no just about running a report or producing a dashboard, it is about taking actions tha change state in those underlying systems. That combination means agents are only good as their understanding of which system owns which truth, and what the contr is between those truths. This is the bull thesis on a company like Databricks - they become the center of gravity for AI Agents, and start to build these agents themselv

Said another way, agents are forcing us to separate the UX of work from the source truth for work. The UX can now be a chat window, a natural language interface, or specialized agent UI that looks nothing like the old enterprise applications. Under hood, though, something still has to say “this is the canonical customer record” or “this is the legally binding contract term” or “this number is the one we report to W Street.” That “something” might be a traditional system of record, it might be a warehouse-backed semantic layer, or it might be a new class of “data control plane” product, but it is absolutely not going away.

This is where I think data warehouses and lakehouses start to look like the natural substrate for many agentic workflows. They already try to centralize data across

starts to look less like a reporting system and more like a “truth registry” that the re
of the company can rely on.

The missing piece is that most of these stacks were designed for humans running queries, not agents orchestrating workflows. Humans can hold nuance in their heac If finance and sales disagree on ARR, they can talk it out and decide which number use for the board deck. Agents cannot. They need explicit rules. They need conflict resolution baked into the data model. They need to know that “official_arr” is the metric we use for external reporting, “sales_arr” is the metric we use for comp plan and “product_arr” is the metric we use for feature level analysis. They need the warehouse to not only store the data but also encode the precedence and meaning c that data.

There is a similar story on the operational side. I do not think CRM or ERP or billir systems disappear. Instead, they quietly evolve into something closer to “state machines with APIs” that are optimized for programmatic access rather than huma UI. The agent initiates the quote, computes the pricing, assembles the contract, negotiates redlines, and then, at the right moment, writes the final state into the downstream system of record through a well defined boundary. The human might s see that state in a web interface, but the primary consumer is an agent. The system record becomes less of a place you click around in and more of a durable storage an constraint engine that machines talk to.

If you believe that world, then the question “are systems of record dying” starts to f a bit like asking “is the database dying” when people moved from client server apps web apps. The form factor is changing. The power center may migrate from monolithic SaaS fronts to shared data layers and workflows. But the need for a next to the warehouse, or next to the CRM, or next to the ERP, and then building opinionated agents that orchestrate work across those systems. Their edge is usuall combination of workflow design, semantic modeling, and tight integration with the customer's existing sources of truth. Underneath the marketing, they are basically wrapping the messy reality of enterprise data in a cleaner contract so agents can operate safely.

There is also a valuation angle hiding in here. Investors love to debate whether "systems of record" get higher multiples than "systems of engagement," and where pure workflow tools land in that spectrum. Agents complicate that framing. An age that sits on top of someone else's data and can be easily unplugged probably does n deserve system of record type durability. An agent platform that becomes the place where metric definitions live, where entity schemas are defined, and where policies about who can do what are enforced, starts to look much more like a source of trut even if the underlying bits are stored in Snowflake or Databricks or some operation database. The multiple will follow the stickiness of the truth, not the buzzword on t slide.

So where do I land. I do not think systems of record are dying. I think they are getti unbundled and rewired. The "record" part, the actual truth, will increasingly live in combination of warehouses, lakehouses, and still important operational systems. O top of that, we will get a new layer of semantic contracts and control planes that tel agents how to safely read and write that truth. The familiar SaaS front ends that use to sit on top of those systems of record will matter less over time. Agents and workflow UIs will become the primary way humans interact with work. But the underlying need for a well defined source of truth, with clear ownership and constraints, will only grow.

ones that build amazing agentic experiences on top of boring, rock solid sources of truth, rather than pretending those sources no longer matter.

Clouded Judgement @jaminball ALTIMETER

Update on Multiples

SaaS businesses are generally valued on a multiple of their revenue - in most cases t projected revenue for the next 12 months. Revenue multiples are a shorthand valuat framework. Given most software companies are not profitable, or not generating meaningful FCF, it's the only metric to compare the entire industry against. Even a DCF is riddled with long term assumptions. The promise of SaaS is that growth in t early years leads to profits in the mature years. Multiples shown below are calculate by taking the Enterprise Value (market cap + debt - cash) / NTM revenue.

EV / NTM Rev / NTM Growth

The below chart shows the EV / NTM revenue multiple divided by NTM consensus growth expectations. So a company trading at 20x NTM revenue that is projected to grow 100% would be trading at 0.2x. The goal of this graph is to show how relatively cheap / expensive each stock is relative to its growth expectations.

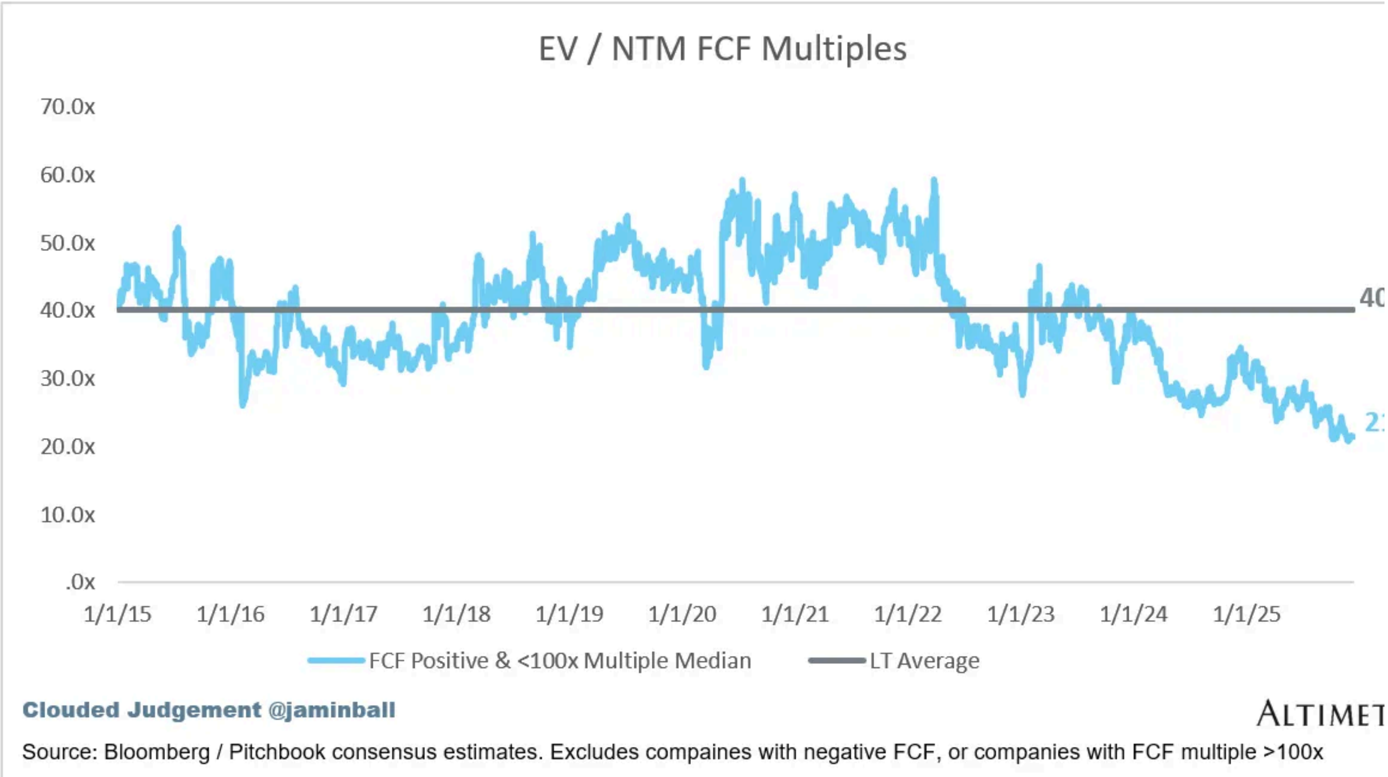
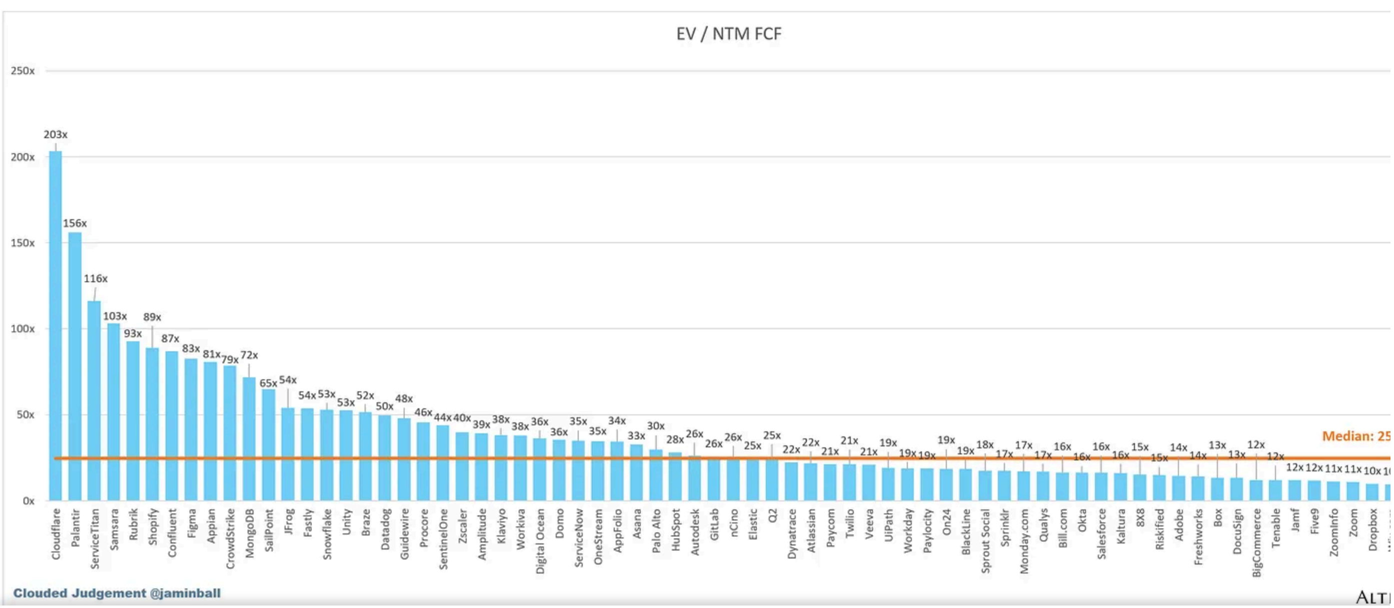
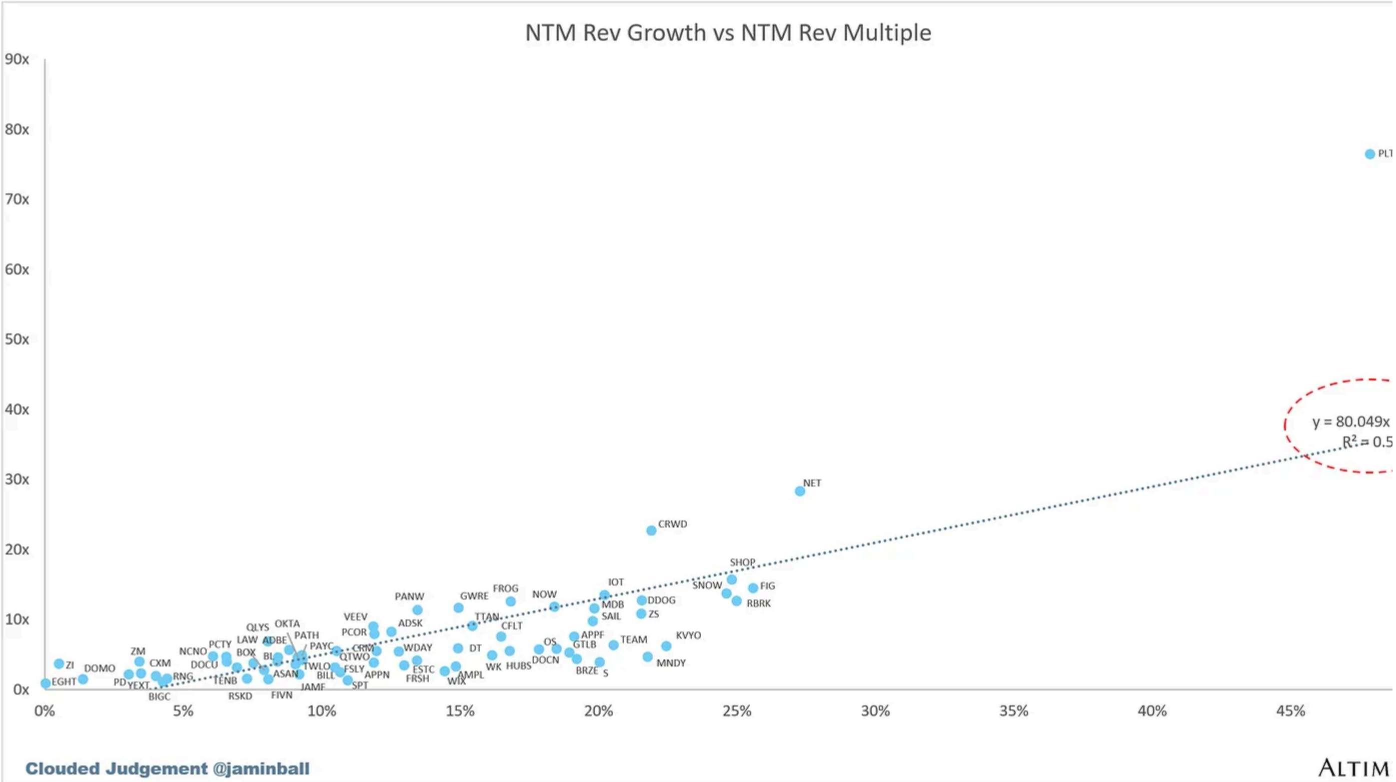
EV / NTM FCF



Companies with negative NTM FCF are not listed on the chart



Cookie Policy



Operating Metrics

- Median NTM growth rate: 12%
- Median LTM growth rate: 13%
- Median Gross Margin: 76%
- Median Operating Margin (1%)
- Median FCF Margin: 20%
- Median Net Retention: 108%
- Median CAC Payback: 36 months
- Median S&M % Revenue: 37%

Rule of 40 shows rev growth + FCF margin (both LTM and NTM for growth + margins). FCF calculated as Cash Flow from Operations - Capital Expenditures

GM Adjusted Payback is calculated as: (Previous Q S&M) / (Net New ARR in Q x Gr Margin) x 12. It shows the number of months it takes for a SaaS business to pay bac its fully burdened CAC on a gross profit basis. Most public companies don't report new ARR, so I'm taking an implied ARR metric (quarterly subscription revenue x 4) Net new ARR is simply the ARR of the current quarter, minus the ARR of the previ quarter. Companies that do not disclose subscription rev have been left out of the analysis and are listed as NA.

	Valuation		Rev Multiple			FCF Multiple		Rev Growth		LTM	Gross	Operating
