

Building the AI-Native Enterprise

Bring standardization and flexibility together
to power the next era of total experience

2026

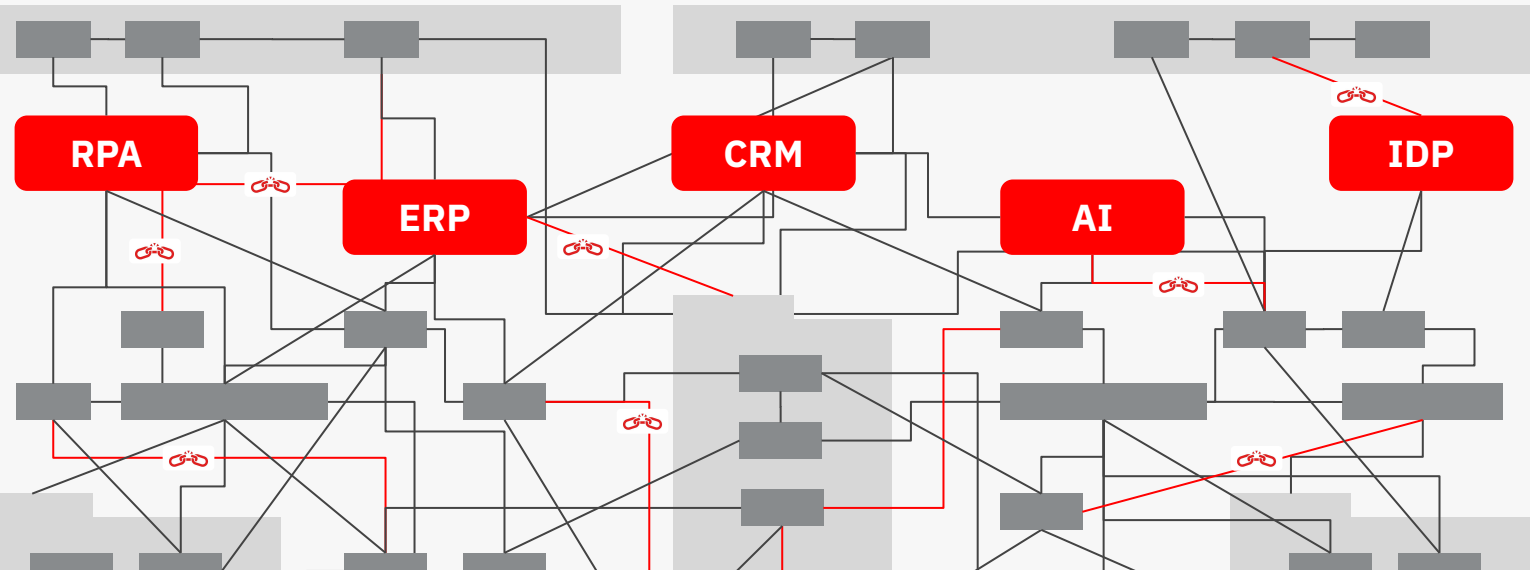

Executable BPMN. Event driven. Transparent.

Fragmentation multiplies inefficiencies

Customer journey

Reduced time to market, ROI, and visibility.

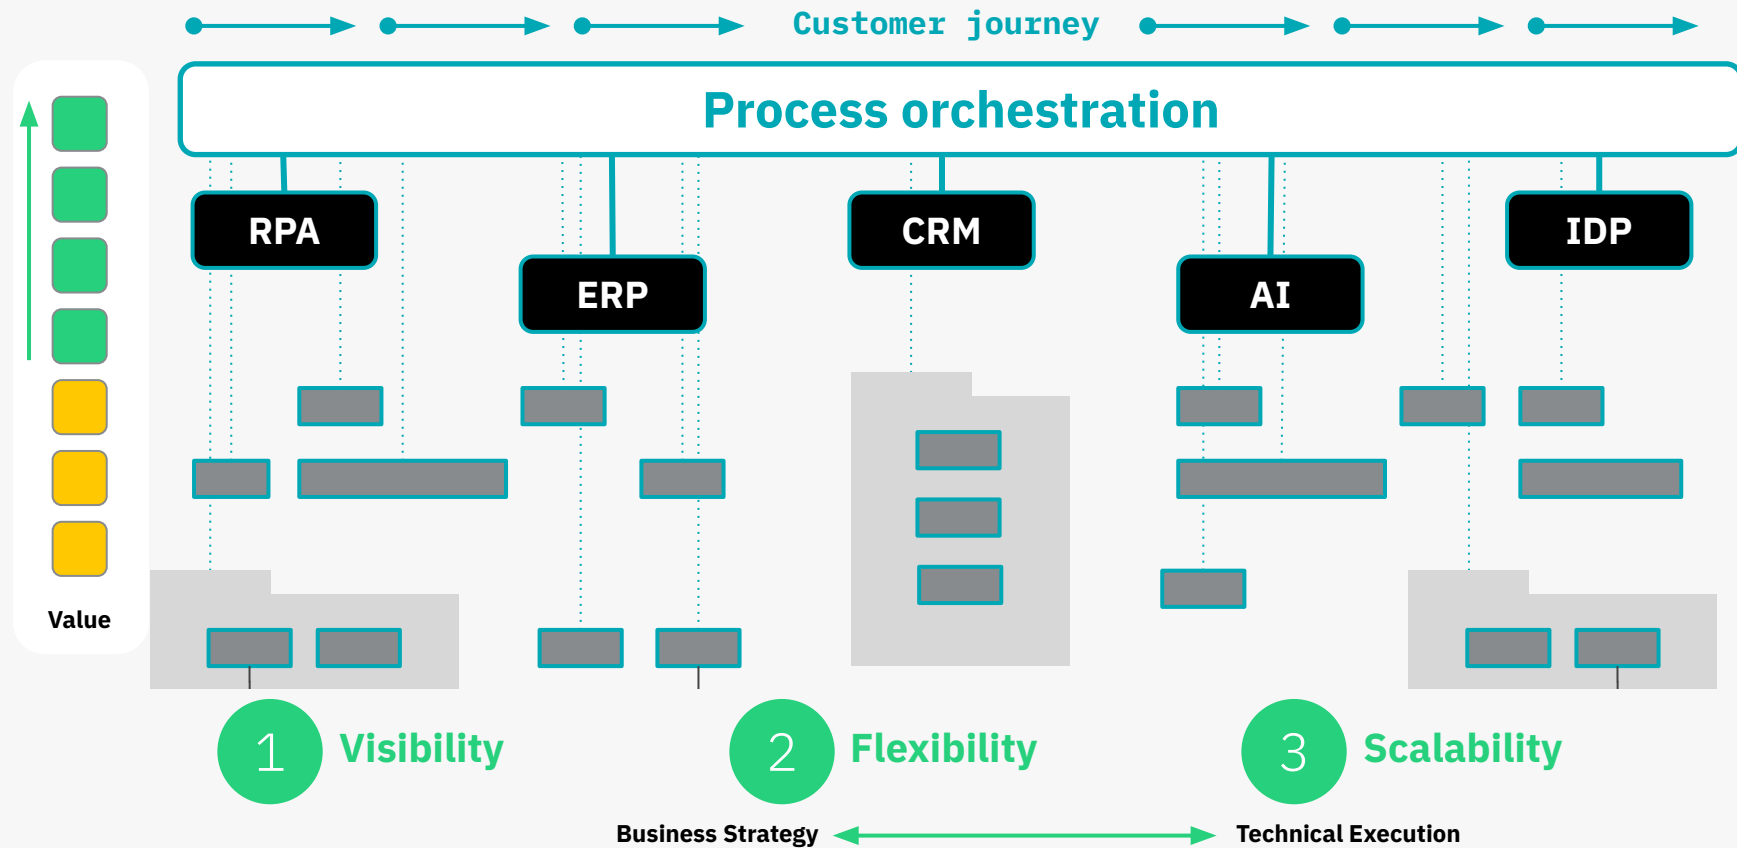

Fragmented approach compounds tech debt and limits innovation and tech value

Business Strategy

Technical Execution

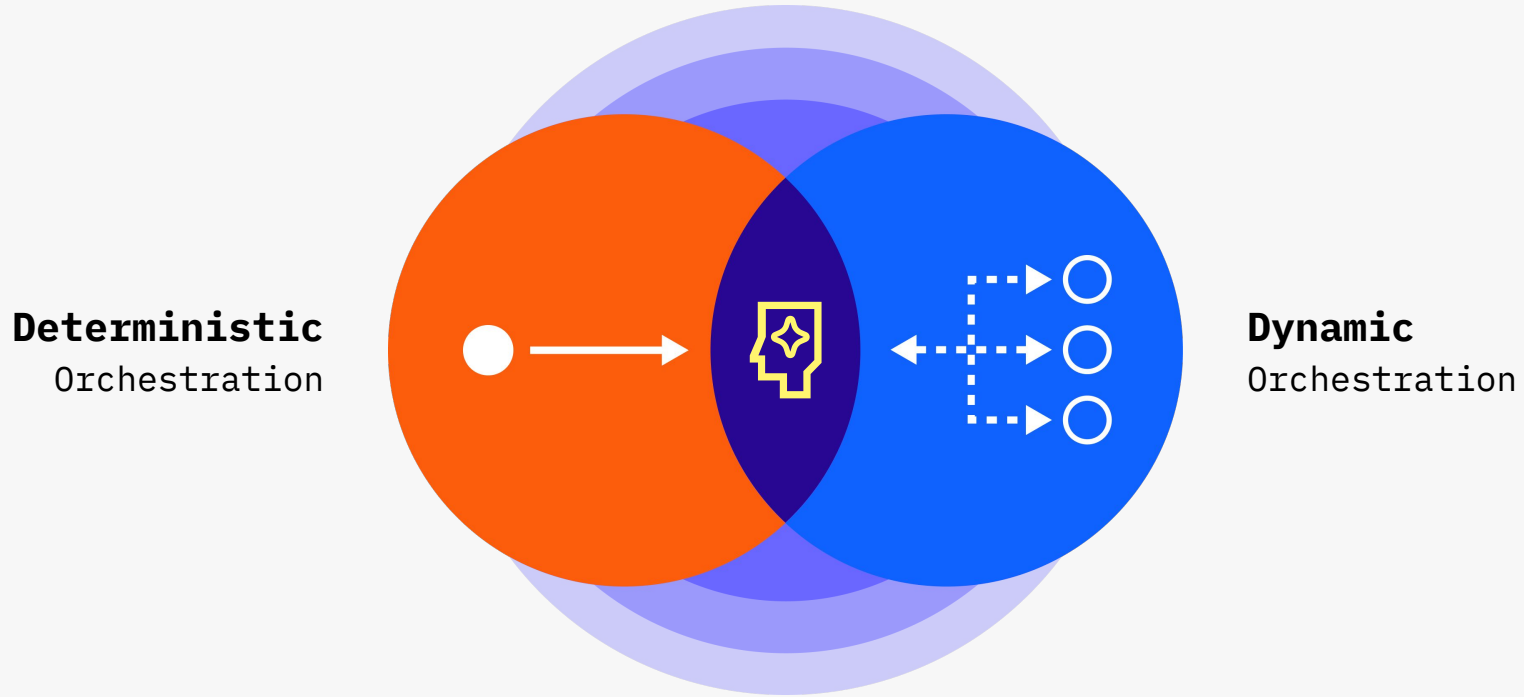

alignment

Buy, build, and blend what works for you

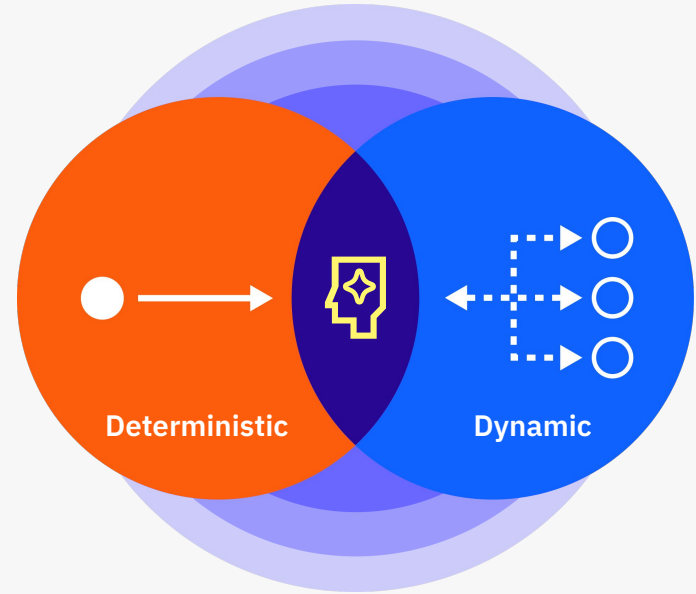

Agentic Orchestration

Coordinating intelligent agents, systems, and people

Agentic orchestration powers the AI-native organization

- **Blends deterministic** and **dynamic** (AI-driven) business processes
- Unites the best of **humans and machines**
- Adds **visibility, auditability**, and **guardrails**
- Handles **long-running, complex**, and **high-performance** processes
- Provides **flexible foundation** to adapt to changing technology and business needs

Challenges for adopting next-era AI

40%

of *agentic AI projects*
will be scrapped by
2027 - Gartner

77%

of leaders are
concerned about
GenAI risks - Deloitte

44%

have already seen
AI output go wrong
- McKinsey & Co

Only 8%

are *scaling AI* at an enterprise level,
embedding the technology into
core business strategy.
- Accenture

From idea to production with total control

“Speed to market skyrocketed.
What took engineers 4–5 days,
product owners now do in 1–2
hours with Camunda.”

“We increased the automation
rate by more than 65% and
reduced average claim process
time by over one-third.”

“We injected AI into our money
transfers process, resulting in
6x faster payment transfers,
and 50% fewer errors.”

Key benefits of agentic orchestration

Full Transparency

One visual model aligns strategy and execution while speeding up time to value

Dynamic Oversight

Precisely control and see every action for consistent experiences and compliance

Performance at Scale

Handle millions of concurrent interactions without slowing down or bottlenecks

Context That Persists

Keeps memory over any length of time; from milliseconds to years

Agentic applications across industries

Financial Crime & Compliance

Banking & Financial Services

Intent-Based Autonomous Networks

Telecommunications

Demand Forecasting & Optimization

Supply Chain & Logistics

Health Insurance Appeals Management

Insurance

Let's design your AI-native enterprise

Assess Capabilities

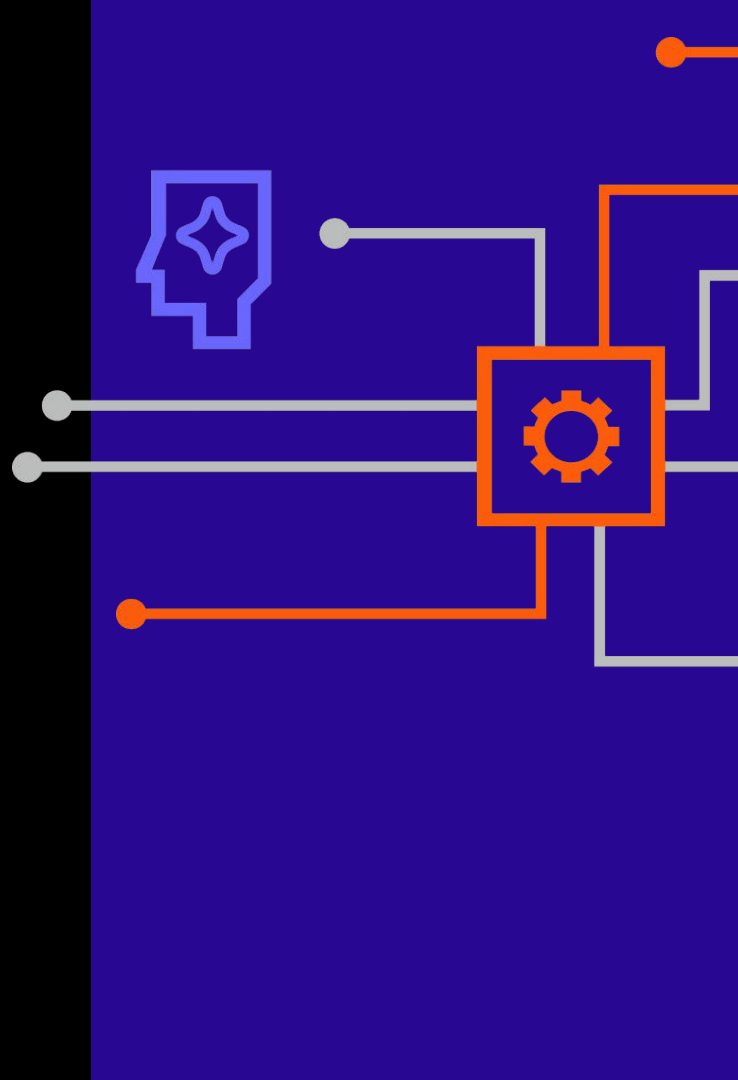

Align your strategic goals and technical capabilities during a more technical discussion.

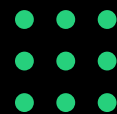

Accelerated Pilot

Our teams work together to identify and build one high-impact agentic process to prove concept.

Partner Collaboration

Your trusted partner. Our expertise.
Increase the output and potential for your agentic projects.

Thank you

Camunda powers the AI-led enterprise

Agentic orchestration solutions built by Camunda partners

Agentic AI Call Quality Audits

Review every customer call, reduce audit times by 94%, and provide performance coaching in real time.

Agentic Trade Exception Management

Speed up resolutions 45% by orchestrating the full trade lifecycle utilizing automation and agentic AI.

Agentic Transaction Monitoring

Reduce false positives, and speed up FCC investigations using AI that learns and improves over time.

Agentic Auto Insurance Claims

Provide 24-7-365 support with a dynamic digital workforce to speed up claims and keep customers informed.

Compliance Monitoring Agent

Catch policy violations in real time, enforce rules, and provide full audit trails with multi-channel insights.

AI Customer Service Agent

Deliver better customer experiences without adding headcount while resolving inquiries in 58% less time.

CAMUNDA

Enterprise-grade Agentic Orchestration

Camunda enables organizations to orchestrate and automate processes across people, systems, and devices to continuously overcome complexity, increase efficiency, and fully operationalize AI. Built for business and IT, Camunda's leading orchestration and automation platform executes any process at the required speed and scale to remain competitive without compromising security, governance, or innovation. Over 700 companies across all industries, including Atlassian, ING, and Vodafone, trust Camunda with the design, orchestration, automation, and improvement of their business-critical processes to accelerate digital transformation.

2025 | Overview | Internal Guidance

Summarized Pitch (“Elevator Pitch”)

- AI is disrupting businesses and business models
- CIO/CTO are investing in AI but face challenges - fragmented AI, tech debt, and complexity (compounding)
- Companies are unable to unlock value
- **Camunda can help** - work with your existing tech and unlock value.
- Our unique value proposition is a composable, open, collaborative, scalable and intelligent PO&A.
- Camunda helps you realize value today and be ready for tomorrow – future-proof process architecture

Personas / Sales Motion Guidance

Company Logo

Is Your Organization Future Ready?

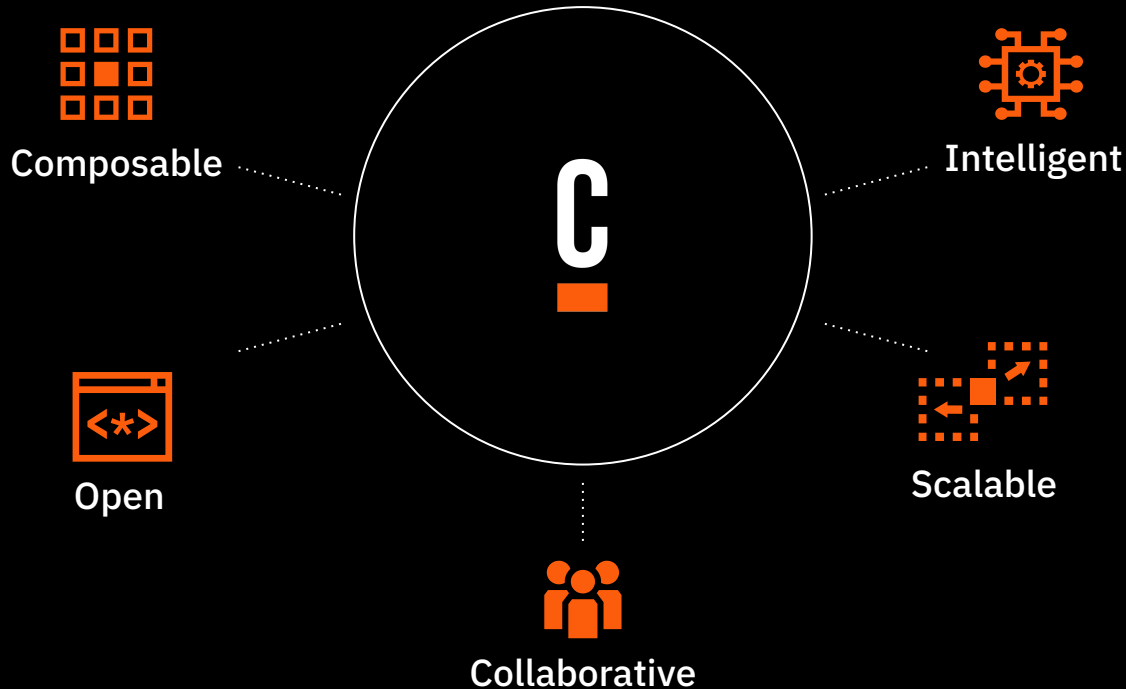

Unlock Value and Operationalize AI with a Composable, Intelligent Process Orchestration and Automation Platform

The Process Orchestration and Automation Platform

Camunda's differentiation is anchored in five principles

Composable

Integrated yet flexible architecture facilitates best-of-breed technology and reuse

“Camunda's agile, microservices-based architecture has provided us with the flexibility to rapidly adapt and configure workflows, empowering us to meet customer demands with minimal reliance on engineering.”

– Nicki Todd, SVP of Technology at [First American](#)

Best of breed without compromise

Combine Camunda task automation with other tools and custom code for maximum flexibility

Orchestrate any tool or service

A connector marketplace and robust SDK make integration easy as well as fully customizable

Flexible implementation options

Choose SaaS or Self-Managed and use your preferred cloud, Kubernetes, identity provider

Open

Integrate with a variety of applications, systems, and services to scale your architecture

“To further automate our business processes, we are using Camunda. The open platform permits the implementation of our individual needs in a way that closed business process management suites just cannot achieve.”

– Marko Lehn, Team Lead Software Engineering at [Zalando](#)

Fits into your tech stack

Works with your preferred source control, CI/CD pipelines, and programming languages

Open standards accelerate teams

BPMN and DMN standards facilitate collaboration and alignment between IT and the business

Developer-friendly design

Well-documented APIs and SDKs, plus polyglot clients, enable easy integration and customization

Collaborative

Align IT and the business using a shared process model and language

“I think of a mortgage process as a constellation of several sub-processes, each of which should be orchestrated by its own right... Using BPMN to model the business process as-is allowed us to bridge the gap between the business and the ‘techies.’”

– Alexander Lorenzen, Domain Architect at [BEC Financial Technologies](#)

Next-level collaboration

IT and business stakeholders build and test processes in a shared modeling environment

Build with reusability in mind

Reusable processes, decision tables, forms, and connectors make onboarding new teams easy

Data-driven improvements

Integrated intelligence provides complete visibility on process health and performance

Scalable

Ensure your most complex, business-critical processes run reliably, every time

“We want to reach the point where Camunda handles all our volumes. We expect this to be in the tens of millions of process instances, every single day. Camunda 8 is cloud-native, so we can add instances easily and always maintain enough headroom to handle an unexpected peak.”

– Larisa Kvetnoy, Director of Operations Technology and Strategy at [Barclays](#)

Unlimited horizontal scalability

Event streaming avoids database bottlenecks and can scale process throughput infinitely

Enterprise-grade resilience

A distributed architecture ensures continuity in the case of hardware or network failure

High availability worldwide

A failover architecture supports replication across global data centers for high availability

Intelligent

Prepare for the autonomous enterprise by blending deterministic and non-deterministic execution

“We're making great progress on blending deterministic with dynamic execution, so that our customers get the ability to handle mission-critical end-to-end processes with the creative power of AI, combined with the reliability and efficiency of deterministic workflow execution.”

– Jakob Freund, CEO and Co-founder of [Camunda](#)

Innovate with visibility and control

Apply AI/ML where it makes sense without sacrificing reliability or regulatory compliance

Eliminate AI silos

Avoid creating AI tech debt by integrating AI/ML into existing end-to-end business processes

Improve team productivity

Assistive AI features such as copilots put process designers on the fast track to value delivery

Process Orchestration & Automation Platform

✦ AI enabled

Design & Implement

Developers and business users collaborate to design processes, decisions, and forms.

✦ Modeler

Design BPMN process models and DMN decision tables, assisted by AI Copilots.

✦ Integrated AI Agents

Model, deploy & manage AI agents alongside process models.

✦ Forms

Drag & drop UI builder to capture data and guide user interactions across your processes.

✦ IDP

Ingest, digitize, and process documents with AI to increase productivity and improve experiences.

■ RPA

Integrated RPA helps bridge the gap between legacy and AI for applications lacking API connectivity.

✦ Connectors & Marketplace

Integrate and operationalize connectivity across all systems and LLMs.

Test & Deploy

Developers and testers ensure the end-to-end process is working as intended.

■ Rapid Process Testing

Simulate processes without affecting production systems and deploy with confidence.

■ CI/CD Integration

Accelerate time-to-market by integrating with your SDLC/DevOps ecosystem.

Automate

Enterprise-grade automation. Built for today's business complexity, loved by developers.

■ Zeebe Workflow & Decision Engine

Cloud-native event streaming for unparalleled scale and resilience.

✦ Workers

AI agents, connectors, RPA, document handling, IDP, and custom workers.

■ Operate

Manage and troubleshoot processes with one model for management.

■ Tasklist

Web app for tasks that must be handled by knowledge workers.

Improve

Teams have the insights needed to fix the highest ROI problems for business processes.

✦ Optimize

Monitor KPIs and analyze performance with one model for visualization.

Manage

End-to-end governance of your Camunda installation.

■ Console

Manage clusters and API keys, review audit logs, and perform one-click upgrades.

■ Identity

Manage applications, APIs, users, and roles.

■ Enterprise SSO

Enterprise single sign-on for consistent authentication and secure user access across your entire organization.

Extend

Complete library of SDKs and APIs to integrate and extend process applications.

Camunda | Operationalize AI *with* Camunda

Operationalize AI so you can drive business outcomes today and be ready for whatever comes next

Intelligent process

Orchestrate AI tools and services

- Introduce generative and predictive AI into existing processes with low risk
- Share reusable AI connectors to govern adoption using centrally managed AI services

Camunda Copilot

Fast track to orchestrated processes

- Enable IT and business users to rapidly prototype process assets with AI-powered assistance
- Designed to enhance BPMN and DMN as a common language for collaboration

Autonomous AI

Intelligent execution and optimization

- Uncover hidden value in your most critical end-to-end business processes
- Blend deterministic and non-deterministic process execution with AI agents

Camunda | Operationalize AI *with* Camunda

Operationalize AI so you can drive business outcomes today and be ready for whatever comes next

Intelligent process

Orchestrate AI tools and services

- Out-of-the-box connectors for popular AI products
- Blueprints for AI-driven business processes

Camunda Copilot

Fast track to orchestrated processes

- BPMN
- FEEL
- Connectors
- Forms
- Play Mode
- Documentation

Autonomous AI

Intelligent execution and optimization

- Agentic AI support through a Next Best Action framework and BPMN ad-hoc sub-process
- ML-ready process execution and performance datasets

Camunda | Agentic Orchestration

Model, deploy, and manage AI-powered agents in Camunda-powered business processes

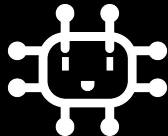

Architect end-to-end agentic processes

Embed agents directly within BPMN process models—agents don't replace processes, they enhance them. Use deterministic flows for predictable behavior, and delegate to agents when AI-driven reasoning adds value.

Build with state-of-the-art agent frameworks

Camunda integrates seamlessly with agentic AI frameworks such as LangChain, giving developers access to agent concepts such as memory, LLMs, tools, and retrieval. Compose end-to-end, long running processes that orchestrate LLMs, external APIs, and humans with full lifecycle control.

Blend code and modeling via multi-layer architecture

Design processes visually with BPMN and extend them programmatically using Camunda's SDKs and custom logic. Embed agents as BPMN tasks, but with full extensibility to configure tool usage and control execution logic—all in a single orchestration layer.

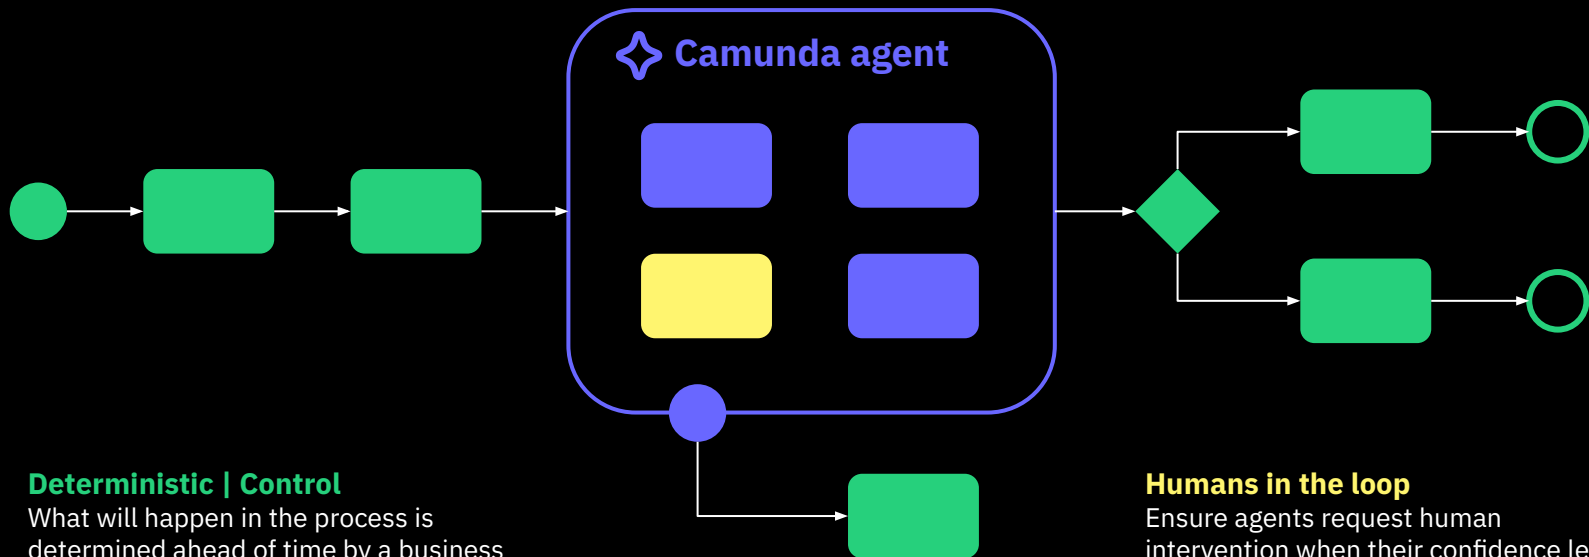

Govern intelligent decisions with human oversight

Agentic orchestration respects confidence boundaries. Agents can request human input when uncertain, or prepare contextual insights for expert validation. This ensures trust, traceability, and compliance in mission-critical flows.

Camunda | Agentic Orchestration

Blend deterministic and non-deterministic process execution to balance control with flexibility

Deterministic | Control

What will happen in the process is determined ahead of time by a business process model defined BPMN

Non-deterministic | Flexibility

An agent determines what happens as the process runs, leveraging AI models and real-time process data

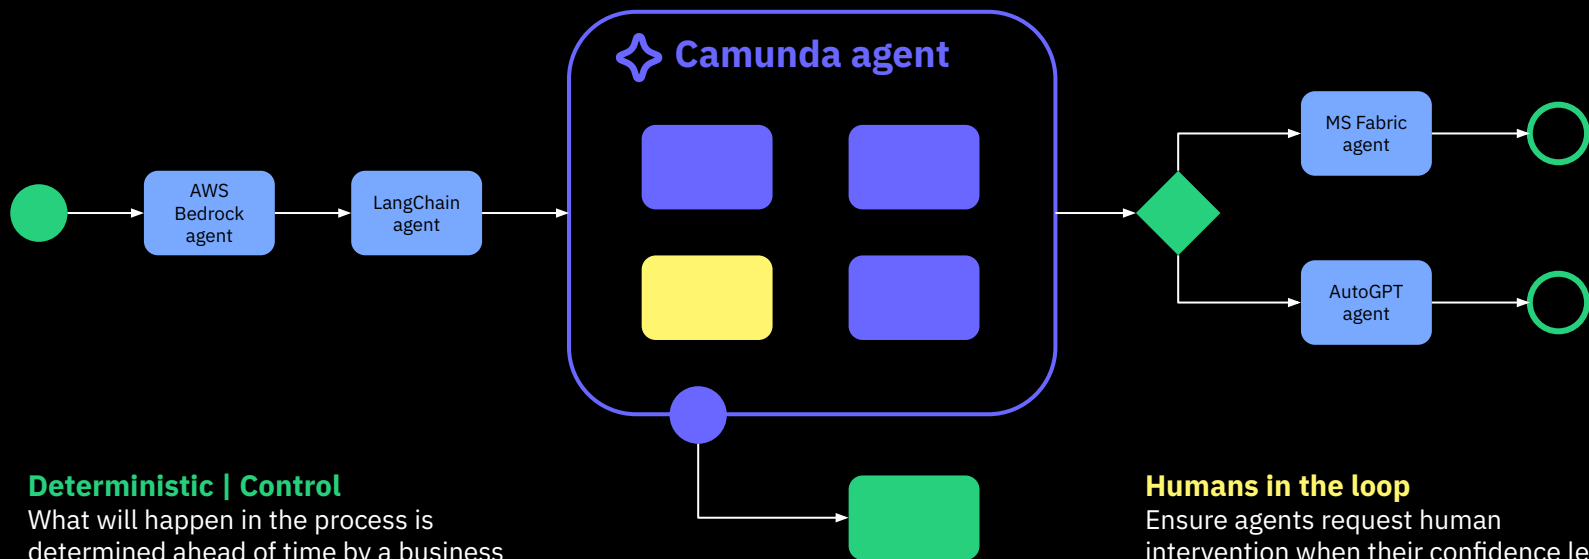

Humans in the loop

Ensure agents request human intervention when their confidence level is low or more data is needed

Camunda | Agentic Orchestration

Combine Camunda agents with agents from other providers, enabling both pro-code and low-code users

Deterministic | Control

What will happen in the process is determined ahead of time by a business process model defined BPMN

Non-deterministic | Flexibility

An agent determines what happens as the process runs, leveraging AI models and real-time process data

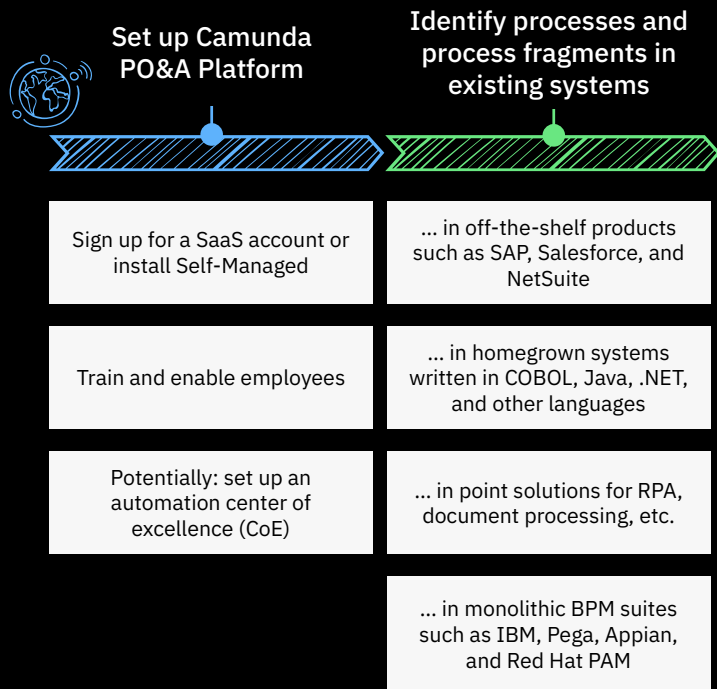

Humans in the loop

Ensure agents request human intervention when their confidence level is low or more data is needed

Orchestrate across agents

Combine agents from different agent builders and swap out agents without redesigning the business process

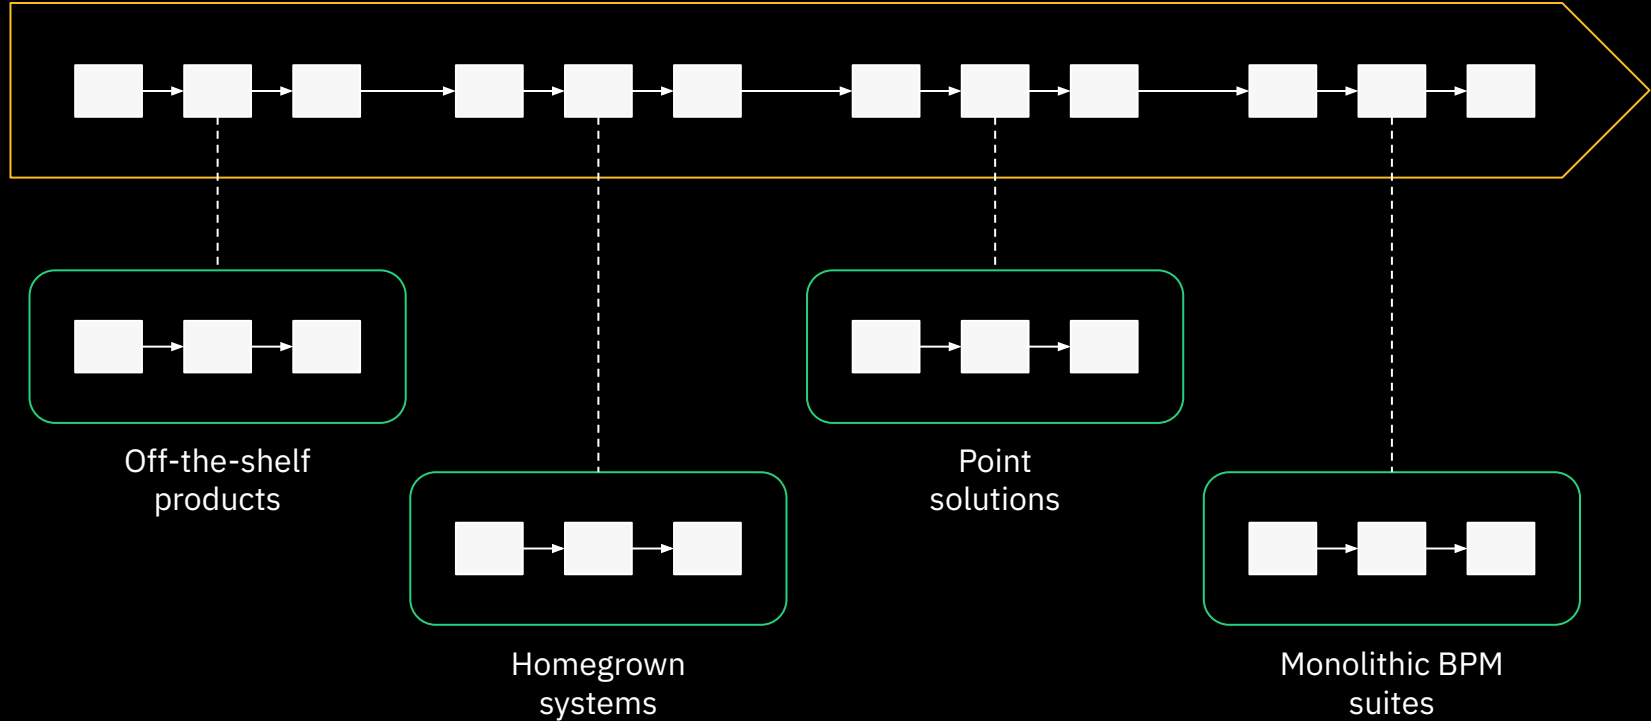

Roadmap to operationalizing AI

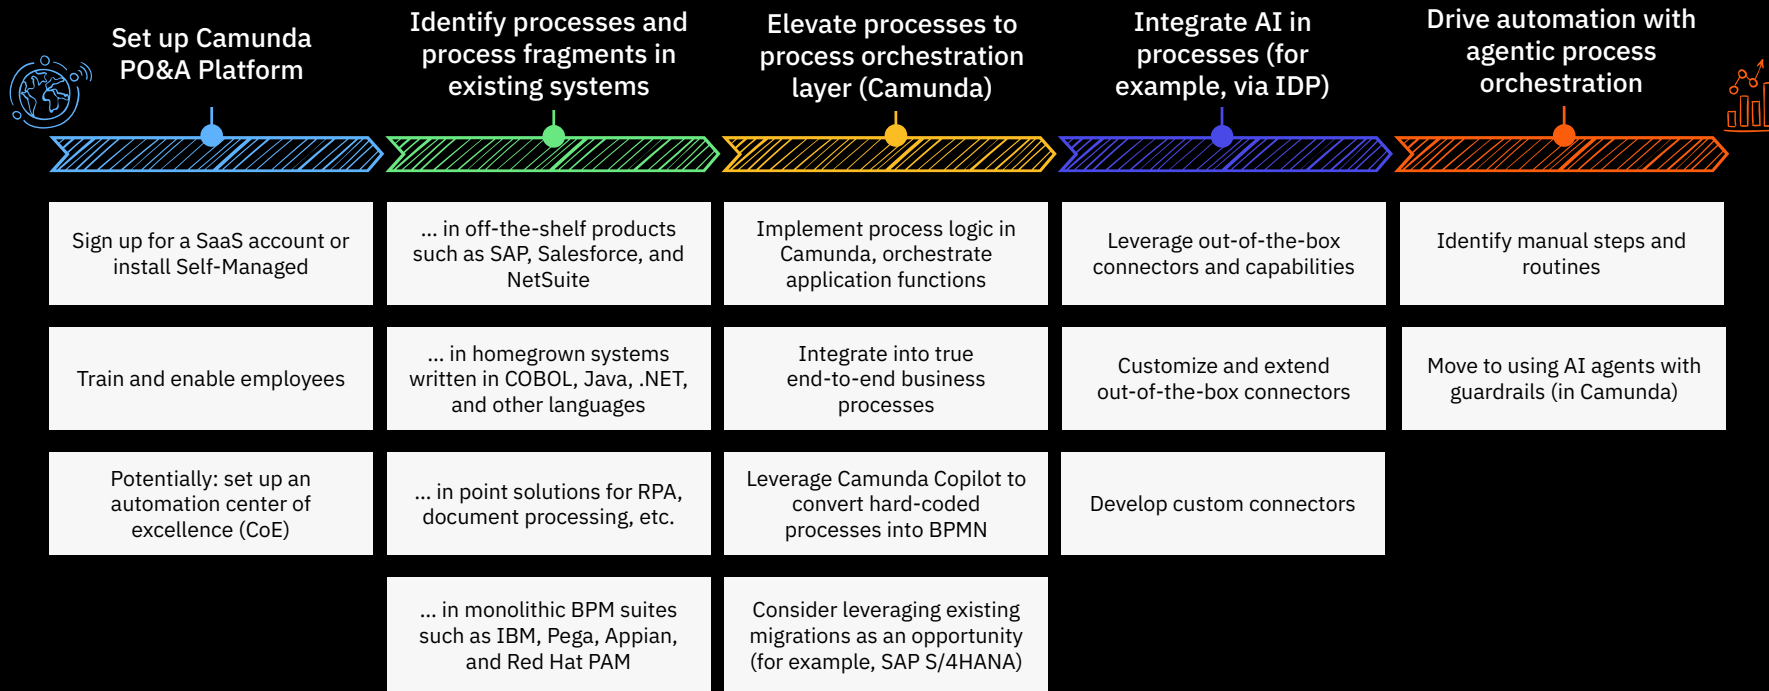

Identify processes and fragments in existing systems

Gain agility by decoupling business processes from systems of record and other tools

Roadmap to operationalizing AI

Thank you

Camunda AI features

Intelligent process

Introduce generative and predictive AI into existing processes with low risk

Camunda Marketplace

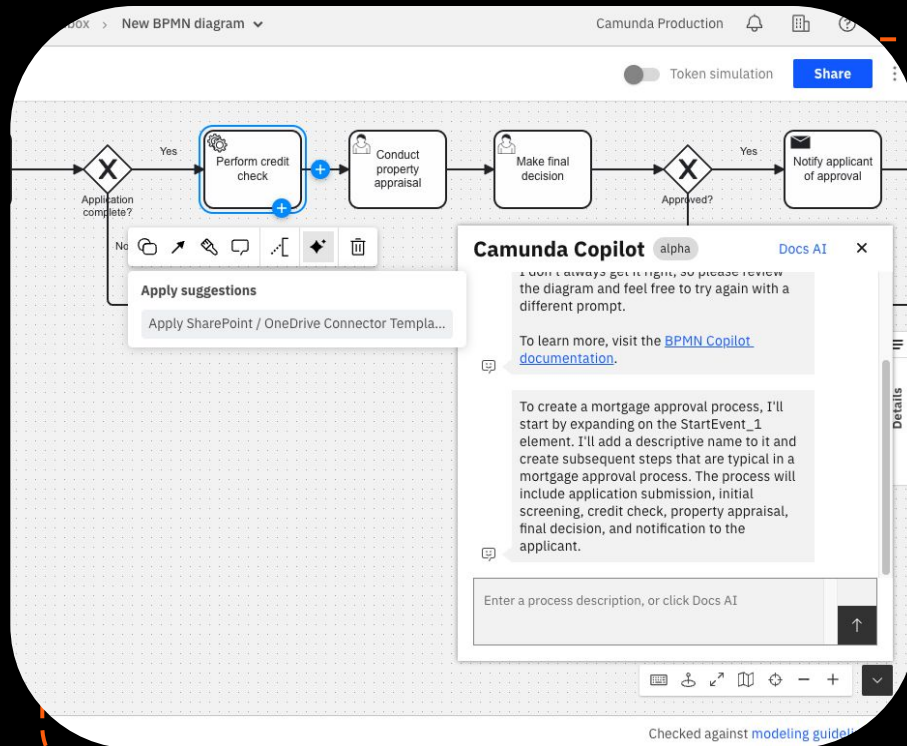

Camunda Copilot

Enable IT and business users to rapidly prototype process assets with AI-powered assistance

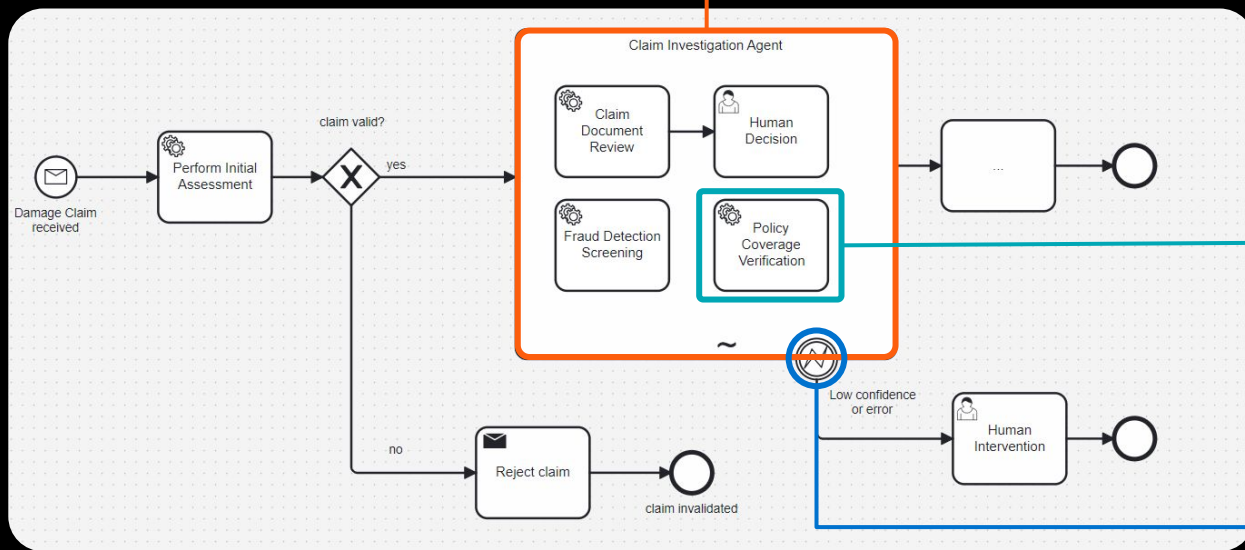

Copilot Capabilities

- Interactive **BPMN Copilot** that creates a process model based on your description, process documentation, or even code
- Suggestions for out-of-the-box **connectors** to use based on your task descriptions
- **FEEL Copilot** that helps you write expressions for use in tasks and connectors
- An AI-powered **form generator** that uses your input to create forms for user tasks
- Play Mode Copilot that provides help for **incidents** when simulating processes
- **Documentation Copilot** that answers your questions using Camunda's technical docs and other resources

Autonomous AI

Uncover hidden value in your most critical end-to-end business processes

Ad-hoc next best action

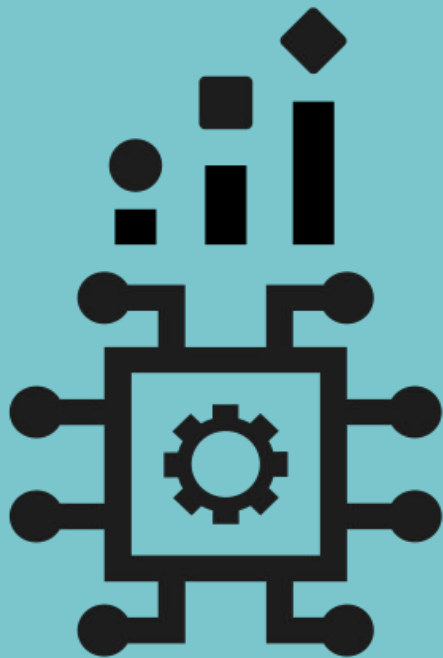

Use the BPMN ad-hoc sub-process to integrate Camunda's next best action framework

Ad-hoc task definition

Define individual actions or processes within the BPMN ad-hoc sub-process

Human in the loop

If the confidence level is too low, involve a knowledge worker to help complete the work

Build Your First AI Agent in Camunda

Follow this step-by-step guide to start developing agentic process orchestration with Camunda today.

Access Your Copy →

camunda.com/blog/2025/02/building-ai-agent-camunda

Camunda components

Modeler

Developers and business users collaborate to design processes, decisions, and forms.

Leverage one model for collaboration

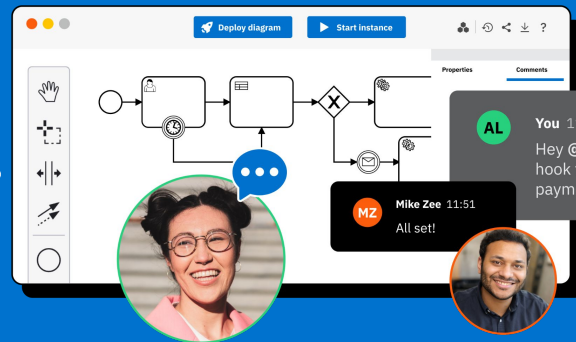

Business stakeholders and software developers use the BPMN standard to model complex business processes, ending siloed, error-prone automation and introducing one process model.

Comment, share, and more

Take advantage of collaboration features such as comments, user tagging, shareable links, embeddable process diagrams, export to BPMN and image formats, and support for milestones.

Automate business decisions

Businesses run on decisions. Use the DMN standard to apply decision-making directly to the same process model. Empower business users to define and update decision tables without IT resources.

Connectors

Tame integration complexity with out-of-the-box connectors for popular technologies.

Connect to all the things

[Camunda Marketplace](#) offers pre-built connectors for task automation tools, AI/ML services, enterprise applications, collaboration tools, content management systems, and more.

Leverage bidirectional connectivity

Outbound connectors enable processes to trigger events in external systems or services, while inbound connectors enable processes to receive messages from external systems or services.

Customize a little, or a lot

Connectors provide a multilayer coding experience for every user. Copy a protocol connector to get started fast, or use the SDK for deep API access that allows you to build custom connectors.

Form Builder

Drag-and-drop form creation for tasks that will be routed to knowledge workers.

Create rich user task forms

Leverage commonly used form controls such as text boxes, radio buttons, checkboxes, drop-down lists, embedded images and videos, and more. Use inline HTML and CSS for quick and easy styling.

Get formatting flexibility

Use conditional formatting, read-only fields, and input validation to ensure forms appear exactly as you want. Forms work seamlessly with Camunda Tasklist and can be embedded in your own apps.

Get started fast with AI assistance

Use natural language to describe your use case. The Camunda Copilot generates a form that you can customize and extend according to your unique business and technical requirements.

The diagram illustrates a form builder interface. A blue rounded rectangle contains a white form. The form has three text input fields labeled "Customer ID", "Customer Name", and "Customer Email Address". To the left of the form is a grey box labeled "Text Field" and a black box labeled "Button". To the right of the form is a black box labeled "Validation Required" with a blue checkmark icon. The form is set against a dark background with a stylized 'C' logo in the top right corner and several horizontal yellow lines on the right side.

RPA

Integrate legacy systems and tools without an API into end-to-end business processes.

Orchestrate all types of bots

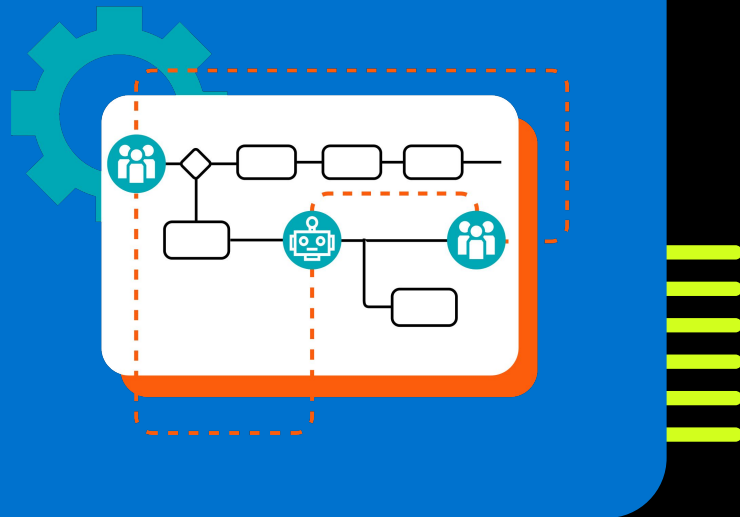

Orchestrate Camunda RPA bots and bots from other providers alongside APIs, AI/ML tools, human work, and more in a unified flow with a process model that everyone can understand and contribute to.

Minimize errors and downtime

Minimize task errors and leverage the power of process orchestration to avoid downtime or process failures that would otherwise negatively impact customers, suppliers, partners, and employees.

Get comprehensive analytics

Analyze and optimize all of your performance data in one unified view. Complete process-level and task-level analytics help teams identify bottlenecks and continuously improve.

Documents

Transform documents into instant insights with AI-powered document processing.

Automate document processing

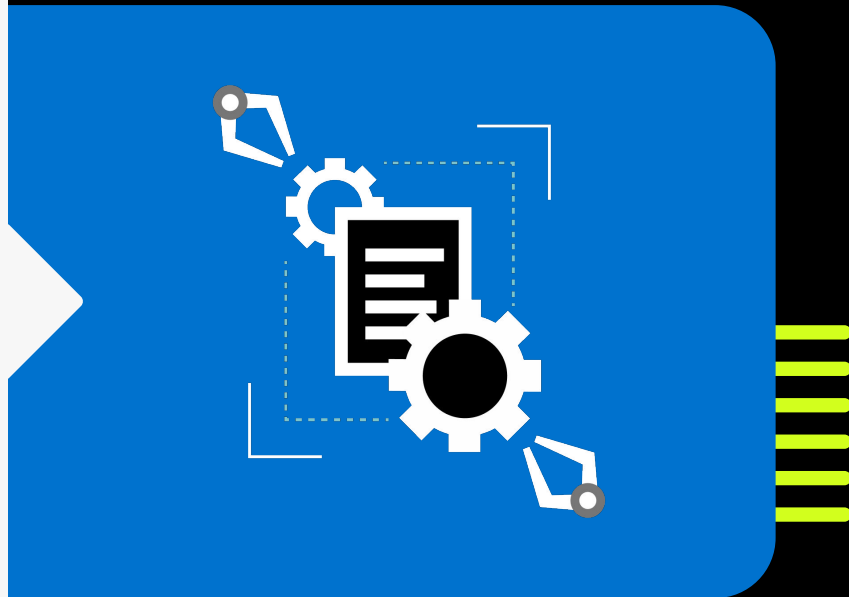

Uncover the data hidden in your documents. Use AI-powered data extraction and automated classification to gain insights from structured, semi-structured, and unstructured documents.

Reduce manual work and errors

Save time and money by automatically extracting critical data so it can be used in processes. Enable knowledge workers to focus on situations where data confidence is low or on more strategic work.

Use your preferred providers

Use your preferred IDP providers and services thanks to Camunda's composable architecture. Avoid vendor lock-in and swap IDP providers without overhauling business process models.

Copilot

Get started fast with a variety of copilot features that turn your ideas into reality.

Create, migrate, and iterate

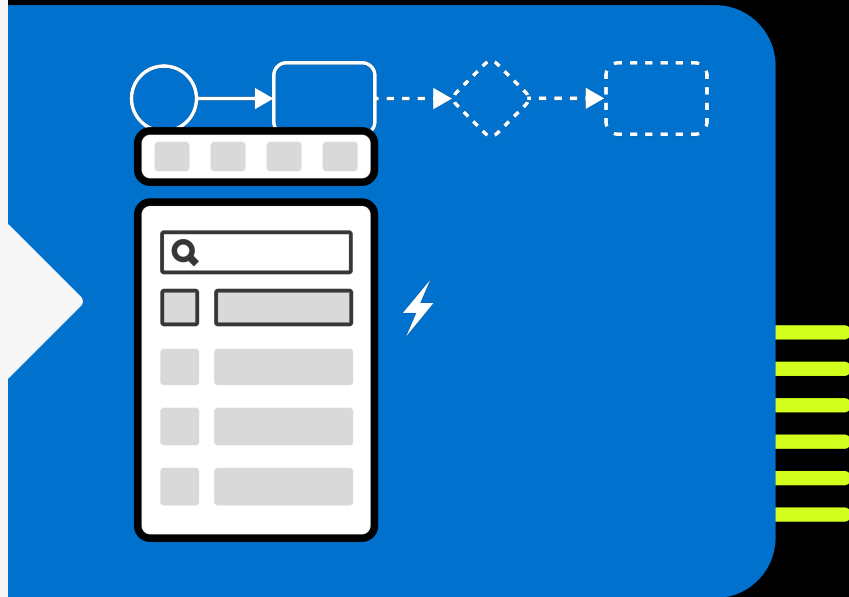

Provide your documentation, raw code, process models from legacy BPM tools—or just describe your use case and the BPMN copilot helps you iteratively design the process you need.

Handle data with ease

Get help with writing expressions in Friendly Enough Expression Language (FEEL) so you can access variables and calculate values for use in BPMN symbols and Camunda connectors.

Use natural language to create forms

Quickly create forms for tasks that will be done by knowledge workers. Simply describe your use case and layout preferences, and the form copilot does the work for you.

Play Mode

Enable all users to simulate processes without affecting production environments.

Leverage one model for testing

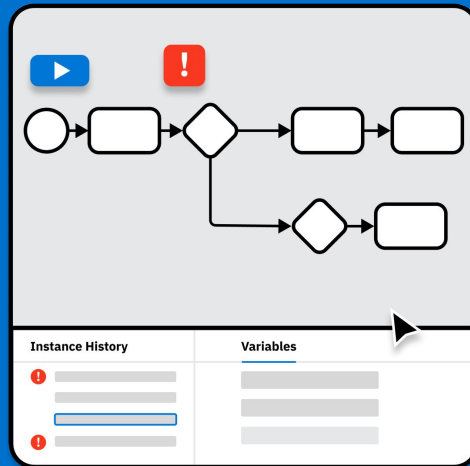

Run simulations of the exact BPMN process model that you build in Camunda Modeler. Visualize the happy path and gain a better understanding of the way the process will work at runtime.

Spin up a test environment fast

Play Mode automatically spins up a playground environment and deploys your process to it. Play Mode doesn't affect running processes, production data, or usage limits.

Ensure you're ready for errors

Simulate error conditions and unhappy paths to ensure the process reacts as expected. For example, if an API or an external system fails to respond to a request, does the process fall back to a backup flow?

Zeebe

Cloud-native event streaming for unparallelled scale and resilience.

Execute with unparallelled scalability

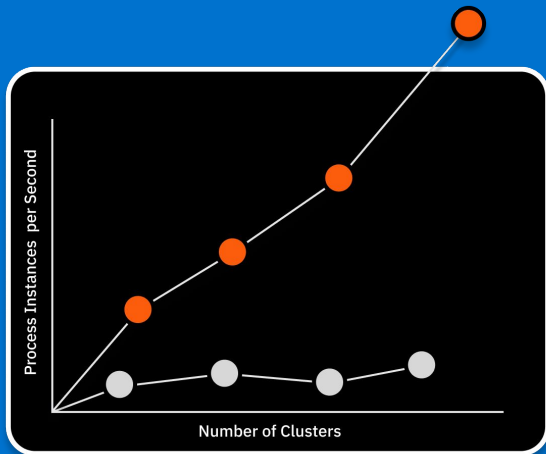

Camunda Zeebe is a distributed system without a central database, so it doesn't have a performance bottleneck. It's easy to distribute processes across clusters to achieve high throughput.

Ensure business continuity

Zeebe provides enterprise-grade resilience by distributing data across all brokers in a cluster with storage directly on the server filesystem. If a broker goes down, another can replace it with no data loss.

Develop in any programming language

Use out-of-the-box clients or your preferred programming language to implement job workers that send commands to Zeebe to deploy processes and execute business logic.

Operate

Manage and troubleshoot processes with one model for process visualization and management.

Leverage one model for management

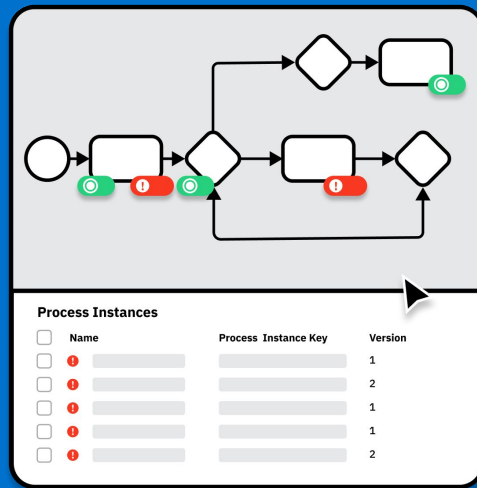

See process instance status and data in the context of the BPMN process model. Understand what's happening with your processes without digging through logs or running traces.

Analyze and resolve incidents

See incidents at a glance and quickly identify which processes are stuck. Troubleshooting tools help operators identify the root cause and take action; for example, by changing variables or moving tokens.

Update processes without fear

Business processes change and evolve. Migrate running process instances to a new version of the BPMN model without interrupting the end user experience, losing data, or losing state persistence.

Tasklist

Web app for human work, with a comprehensive API for custom front-end applications.

Instant UI for any process

Tasklist works out-of-the-box with any Camunda process that includes user tasks. You can opt to customize the Tasklist UI using our drag-and-drop Form Builder with built-in AI assistance.

Route tasks intelligently

Combine Tasklist with our AI-enabled process blueprint to leverage AI and decision automation for task routing. Ensure knowledge workers only handle the tasks they need to.

Bring Camunda UI into your apps

Combine Camunda-based forms with the front-end applications your users are familiar with. Use the Tasklist API to integrate any front end with a Camunda back end for process orchestration.

The image displays a mockup of the Tasklist web application interface. It features a 'Tasks' sidebar on the left with a 'My Tasks' dropdown and a 'Review application' task highlighted. The main area shows a form titled 'Tasklist' with fields for 'First Name*' (Hannah), 'Last Name*' (Cartwright), and 'Identification Type*' (Passport). A 'Decision*' section has radio buttons for 'Accepted' (selected) and 'Rejected'. A 'Complete Task' button is at the bottom right. The interface is set against a blue background with a white speech bubble shape on the left and yellow horizontal bars on the right.

Optimize

Teams have the insights to fix the highest ROI problems for business processes.

Leverage one model for visualization

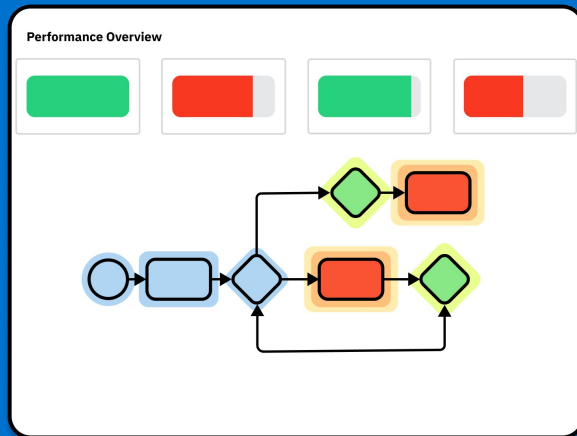

Show the reality of what's working in your process – and what needs improvement – using detailed dashboards created with your process data. See everything in the context of your process models.

Customize for your business needs

Create and customize reports and dashboards, or start with reports that are auto-generated when you deploy a process. Use built-in business KPIs or define your own and set up alerts.

Analyze every piece of process data

Export process execution data in a format that's ready to import into popular open source machine learning tools such as scikit-learn and pandas.

Console

Full governance over your Camunda installation and usage, SaaS or Self-Managed.

Create and manage clusters

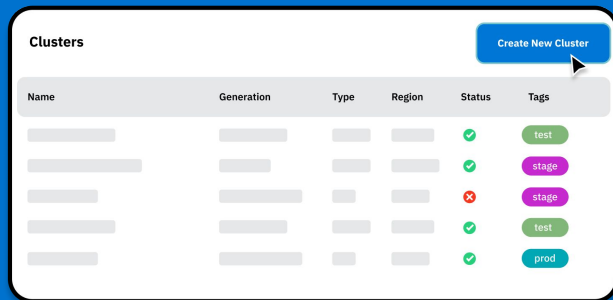

Create clusters to scale process execution capacity horizontally. Monitor the health of clusters and tear down those that are no longer needed.

Upgrade with a few clicks

Get notifications when a new version of Zeebe is available and upgrade clusters with a few clicks. No need to run upgrade scripts.

Manage app and user permissions

Take control of authentication and authorization for external applications and APIs. Add and remove users, assign roles, and configure permissions.

Camunda Marketplace

Accelerate connectivity with Camunda Marketplace

A trusted source of integration technologies from Camunda, our partners, and our global user community

CAMUNDA 
marketplace

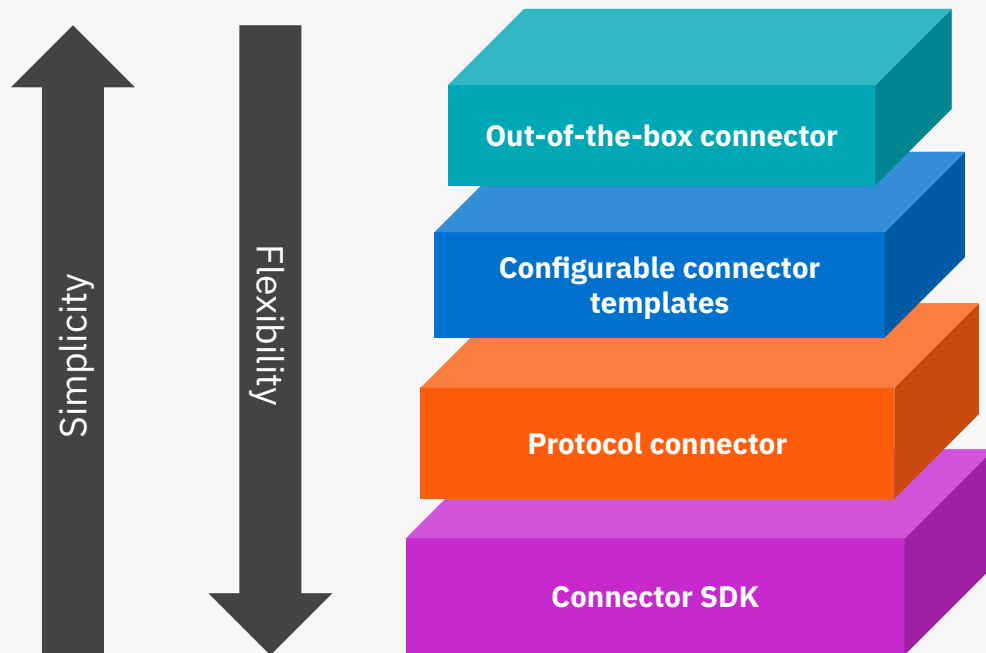

- Browse a wide variety of connectors for enterprise applications, popular technologies, productivity tools, AI/ML services, and more
- Install in your Camunda SaaS account with a few clicks or download for easy installation in Camunda Self-Managed
- Customize and extend connectors by adjusting properties, setting defaults, and adding functionality
- Share approved connectors across projects or teams to encourage reuse within your organization's guardrails

Camunda connector architecture

Intuitive, scalable, and customizable multilayer coding experience for every user

Camunda robotic process automation

Managing RPA without process orchestration presents many challenges

Common RPA Challenges

- Fragmented automation is implemented via isolated RPA bots without an overview of the end-to-end business process
- Fragmentation makes it hard to monitor, manage, and optimize RPA bots
- It's difficult to manage the cost and complexity of multiple RPA tools
- A proliferation of RPA bots can result in technical debt and vendor lock-in that's hindering your ability to adapt to new business requirements

RPA With Camunda

- Move beyond isolated bots to orchestrate end-to-end business processes that combine bots, APIs, microservices, AI/ML, and more
- Gain process visibility so you can fix broken processes and identify process improvements that will have the highest ROI
- Reduce costs and complexity by only using the RPA functionality you truly need
- Give teams flexibility to address new business requirements through a scalable, composable process architecture

Get the most out of RPA with process orchestration

Automate processes from end to end

Orchestrate RPA bots, AI/ML, APIs, microservices, legacy systems, human work, and more in a unified process flow

Deliver automation projects faster

Rapidly implement task-level and process-level automation for the core processes that make up your business

Integrate bots seamlessly

Mix-and-match bots from different vendors and enhance task automation without re-implementing processes

Minimize errors and downtime

Minimize task errors and leverage orchestration to avoid downtime that would impact customers

Align knowledge workers and bots

Automate repetitive tasks, boost knowledge workers' productivity, and enhance team efficiency

Get comprehensive analytics

Complete process-level and task-level analytics help teams identify bottlenecks and continuously improve

Get the most out of RPA with process orchestration

1

Integrate with legacy systems

Automate tasks on systems that don't offer an API as part of end-to-end business processes. Reduce or even eliminate repetitive and error-prone manual work on legacy software.

2

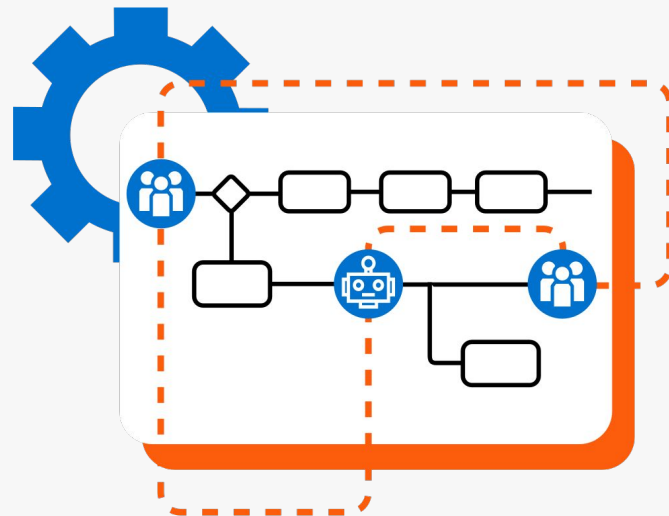

Automate across all endpoints

Automate complex business processes from start to finish by integrating RPA bots, microservices, AI/ML tools, enterprise applications, human work, and more in an end-to-end flow.

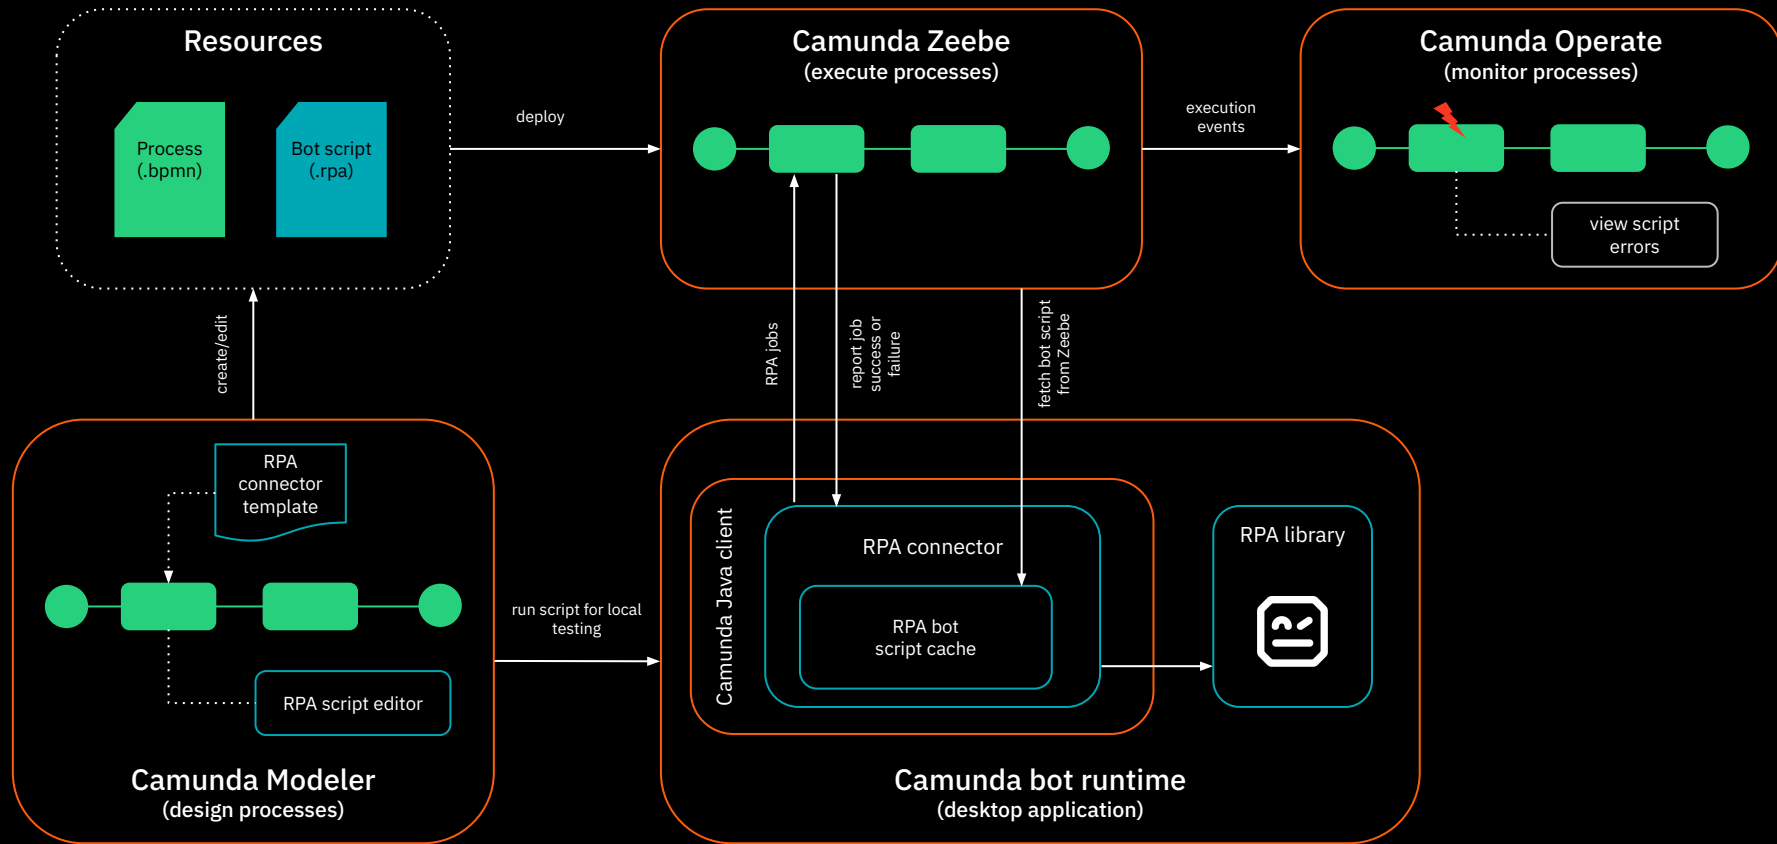

3

Scale up as demand increases

Optimize business processes by deploying RPA where it has the most value today and by swapping out bots for APIs without having to redesign your processes.

How Camunda RPA works

Camunda intelligent document processing

Document-dependent business processes need process orchestration

Common IDP Challenges

- Fragmented automation is implemented via isolated document tasks without an overview of the end-to-end business process
- Fragmentation makes it hard to monitor, manage, and optimize document-dependent business processes
- It's difficult to manage the cost and complexity of multiple tools for document handling, processing, and analysis
- An inflexible approach to IDP prevents teams from adapting to changing business and compliance requirements

IDP with Camunda

- Move beyond isolated IDP implementations to orchestrate end-to-end business processes that combine documents, APIs, AI/ML, and more
- Gain process visibility so you can identify ways to improve document processing
- Reduce costs and complexity by only using the IDP functionality you truly need
- Give teams flexibility to address new business requirements through a scalable, composable process architecture

Transform documents into instant insights

Automate processes from end to end

Automate document handling and processing in a unified process flow with RPA, AI/ML, microservices, and more

Deliver automation projects faster

Rapidly automate document-based processes to reduce manual effort, increase efficiency, and reduce errors

Integrate documents seamlessly

Plug-and-play document handling and processing from multiple IDP providers in a unified business process

Get maximum flexibility

Use your preferred IDP providers and services thanks to Camunda's composable orchestration architecture

Align human and machine workers

Automate repetitive tasks, boost knowledge workers' productivity, and enhance team efficiency

Comprehensive analytics

View document execution data in the context of business processes to better understand performance

Transform documents into instant insights

1

Get process visibility and control

Collaborate, deploy, monitor, manage, and improve complex business processes with all document processing tasks included as part of an end-to-end process flow.

2

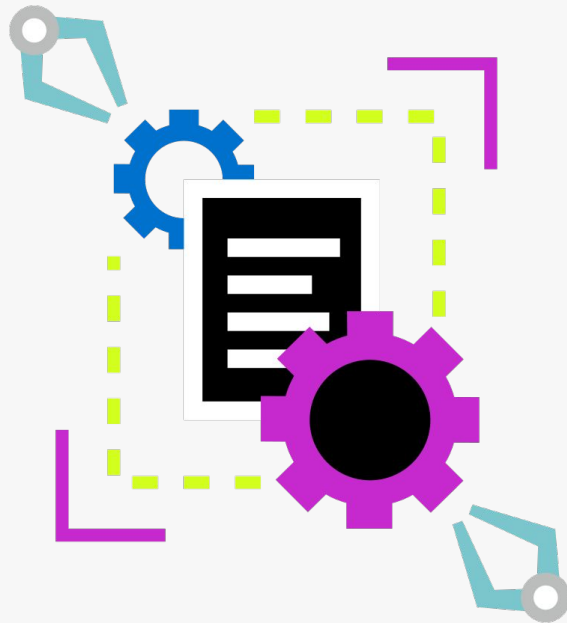

Native integration with Camunda

Plug-and-play document intelligence into business processes without integration effort. Mix-and-match built-in Camunda IDP with other document processing tools and services.

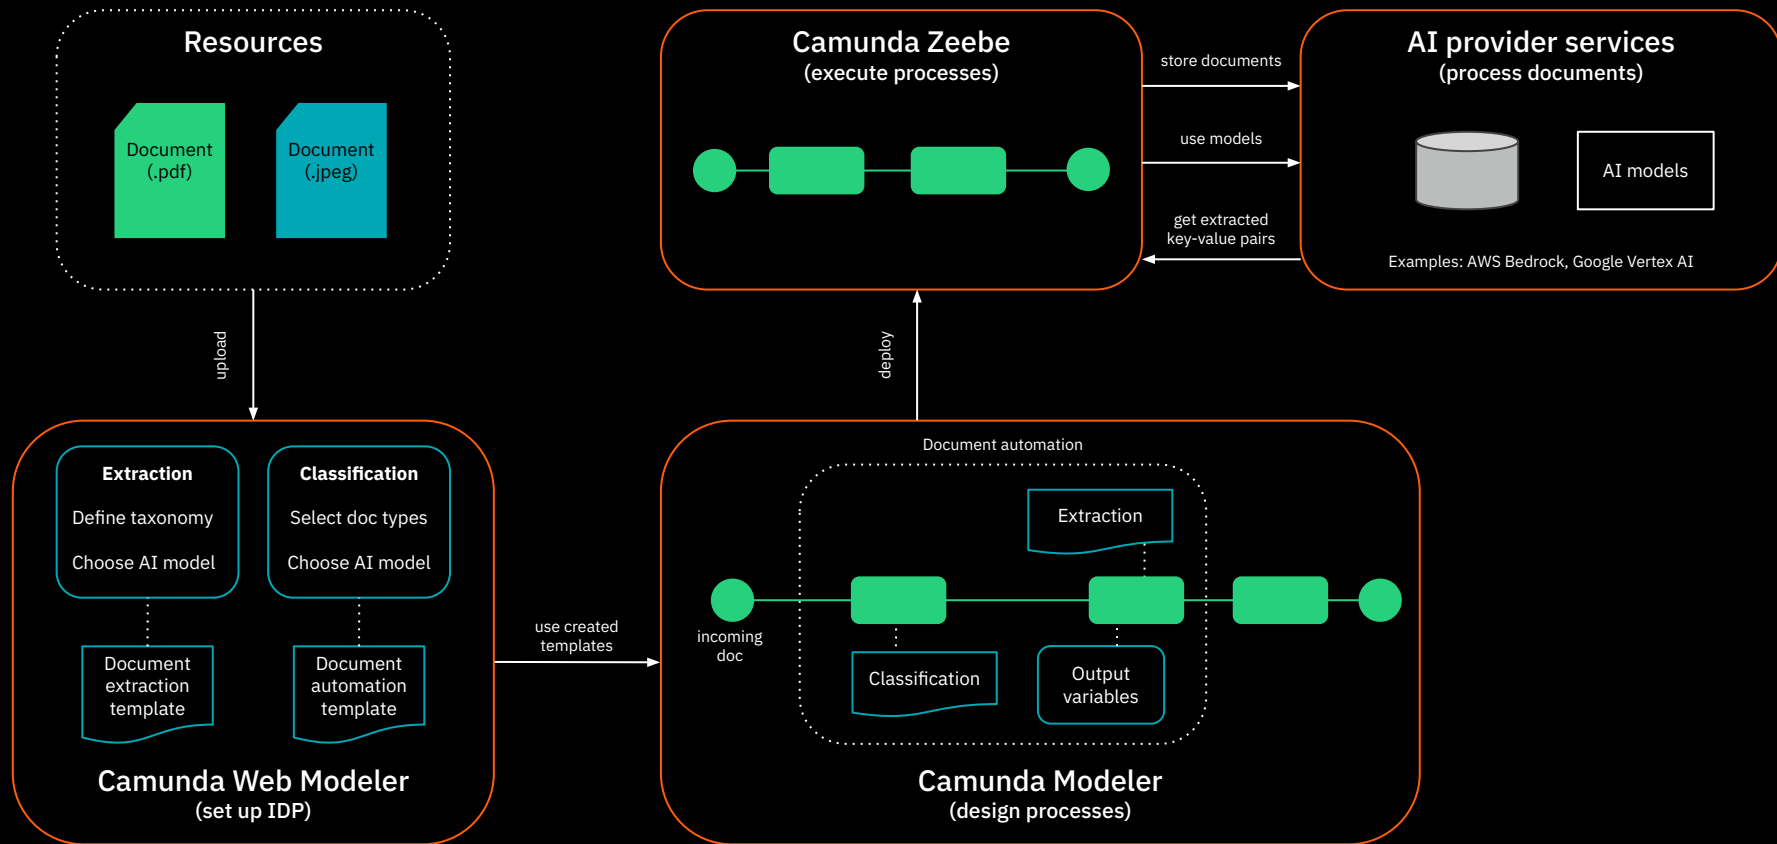

3

Composable architecture

Leverage Camunda integrations for maximum flexibility with IDP providers. Use multiple providers and switch between providers without redesigning business processes.

How Camunda IDP works

Camunda packaging and deployment

Camunda SaaS Offering

We host, guarantee uptime, and handle setup and maintenance

Free

- All process modeling features available
- Community support

Enterprise

- Full feature set available
- Production and non-production clusters available
- Define your usage plan
- 8x5 or 24x7 support
- Enterprise SLA and legal terms
- Training and consulting available

Camunda Self-Managed Offering

You host and are responsible for uptime, setup, and maintenance

Free

- Source-available license
- Production usage of Desktop Modeler allowed
- Non-production usage of all other components allowed
- Community support

Enterprise

- Commercial agreement
- Production usage of all components allowed
- 8x5 or 24x7 support
- Customer success management
- Training and consulting available

- Technical Account Management
- Camunda 7 to 8 Migration Guidance
- Process Orchestration Adoption Framework

Introduce Camunda to your organization seamlessly

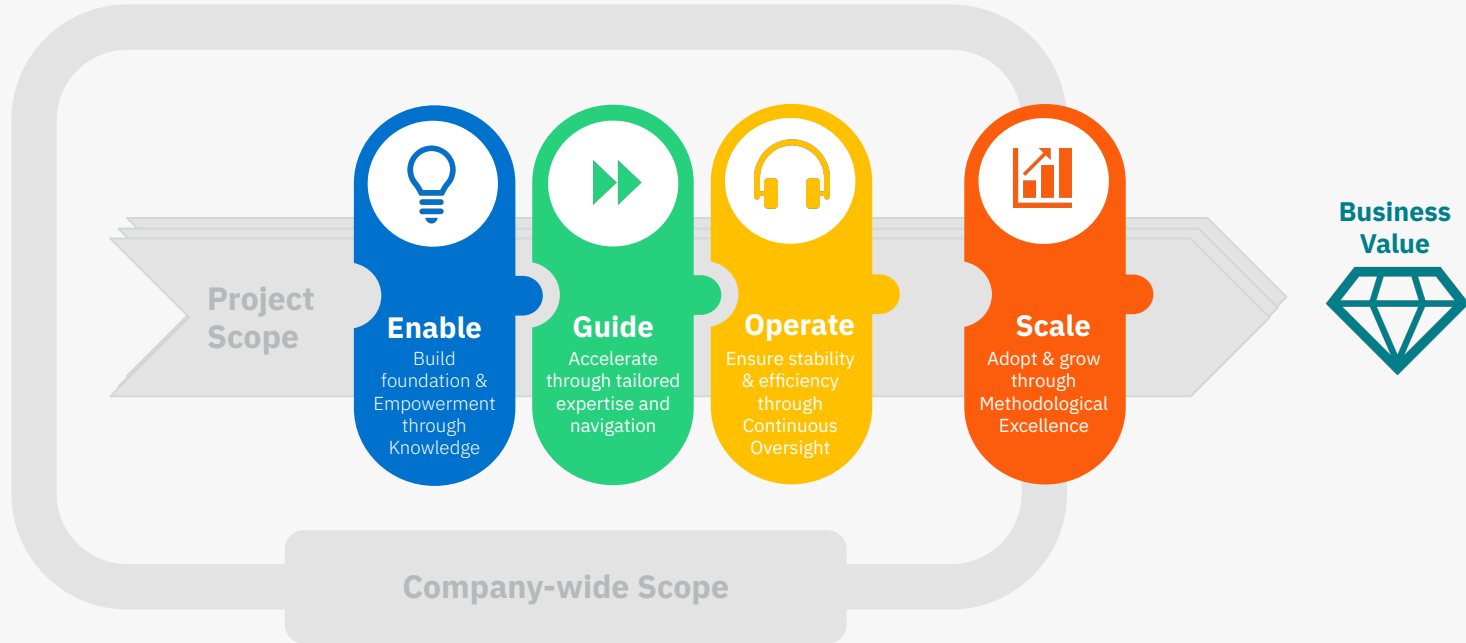

Successfully adopt Camunda process orchestration and automation at scale

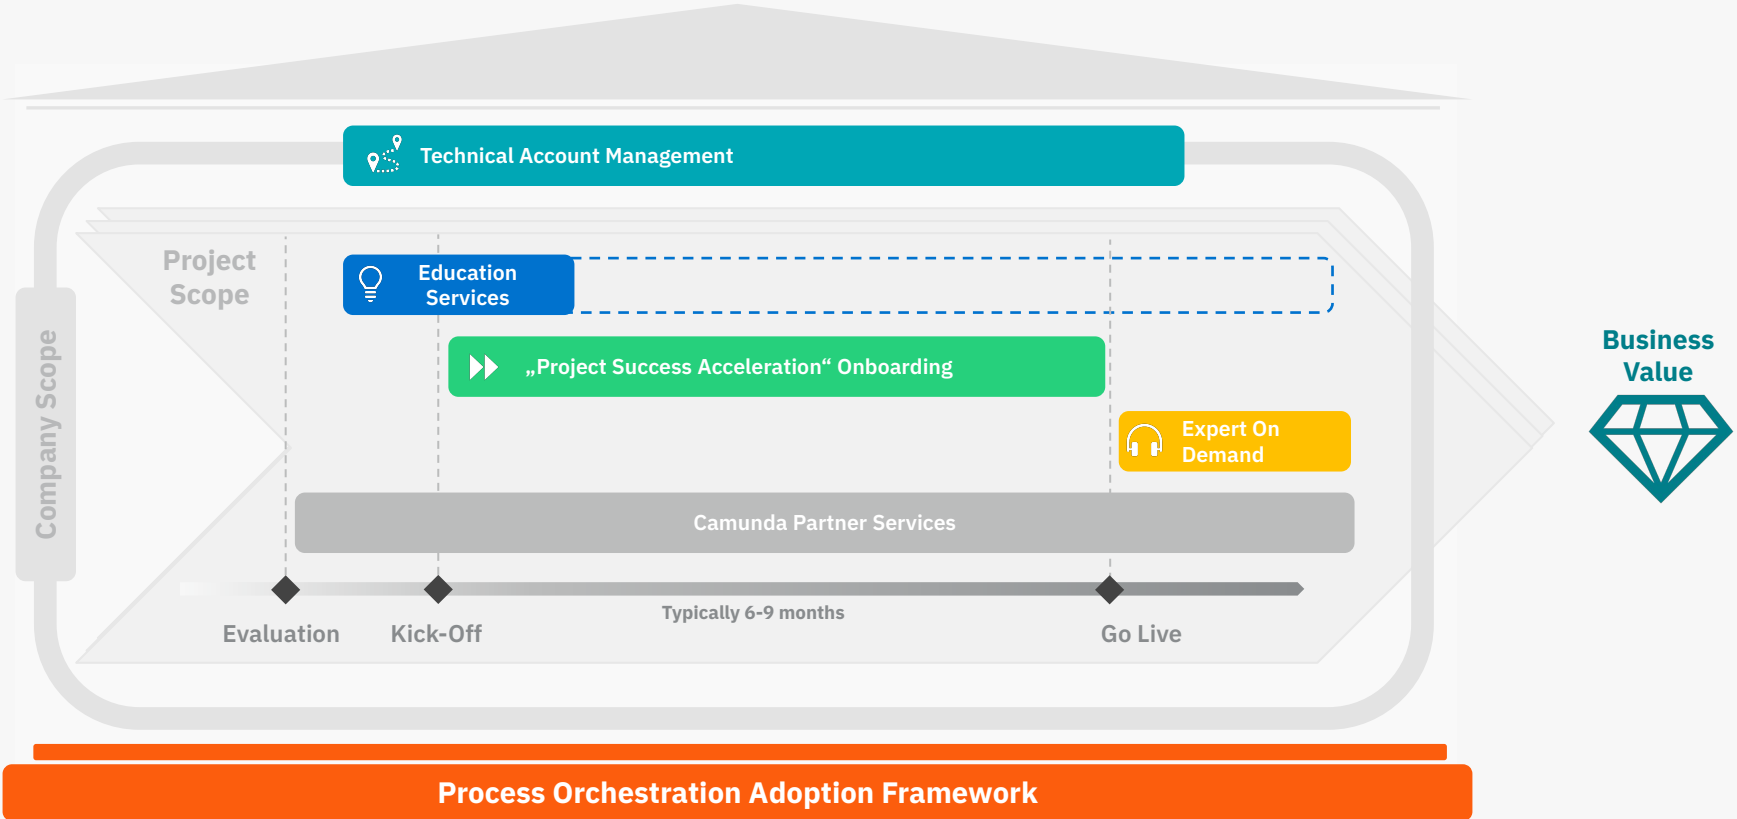

Maximize the value of process orchestration and automation for your organization

Consulting Services Overview

Consulting Services in Detail

Camunda Service Offerings

Camunda post-sales consulting services are here to guide you from day one

Education Services

Seamless enablement for all Camunda adopters anytime, anywhere

- On demand (24/7)
- Instructor-led (bespoke)
- Courses for all stakeholders
- Multiple languages available

Consulting Services

Maximize outcomes for your Camunda project through expert guidance

Project Success Acceleration (ProSA)

- Technical onboarding
- Implementation guidance
- Risk mitigation
- Go-live check

Expert On Demand (EoD)

- Custom scope consulting

Technical Account Management

Your trusted advisor for organisation-wide adoption

- Technical program management
- Technical centralization and evolution guidance
- Use case discovery and evolution guidance
- Value management advisory

Customer & Partner voices about ProSA

“We have teamed with Camunda's ProSA (Project Success Acceleration) program on three separate clients across the financial, retail, and transportation industries. **Our experience has been overwhelmingly positive.** [...] **We actively request our clients to utilize their ProSA consulting hours** at various, strategic checkpoints during our projects. [...] By doing so we **de-risk the process for our clients.** Often we uncover techniques that allow us to **compress project timelines** and allow the inclusion of new features within the same delivery windows”

“Overall, our **experience has been very positive.** Specifically, the **sound expertise** related to application configuration, system sizing and related scalability was directly and efficiently assisting the internal team's efforts to provide an appropriate Camunda set-up which balances the overall D7 scalability requirements versus the costs for the related cloud consumption. In that sense **our partnership with ProSA significantly contributed to the know-how build-up of the internal team and lowered the pressure on this team to a large extent**”

“Overall, the partnership with Camunda Consulting **helped us significantly in the design of new processes and increasing their efficiency.** Furthermore, it enabled us to considerably expand the expertise of our Camunda and IT teams to find new innovative solutions.”

Camunda use cases

Popular Camunda use cases

IT Initiatives

- Building a centralized process automation platform
- Replacing a legacy business process management suite (BPMS)
- Replacing homegrown workflow technology
- Moving applications to the cloud

Technical Use Cases

- Human workflow automation
- Microservices orchestration
- RPA bot orchestration
- Decision automation
- Document management

Business Processes

- Customer onboarding and data management
- Order management
- Claims management
- Loan origination
- Risk management and underwriting

IT initiatives

Use Camunda as the engine to power modernization and centralization

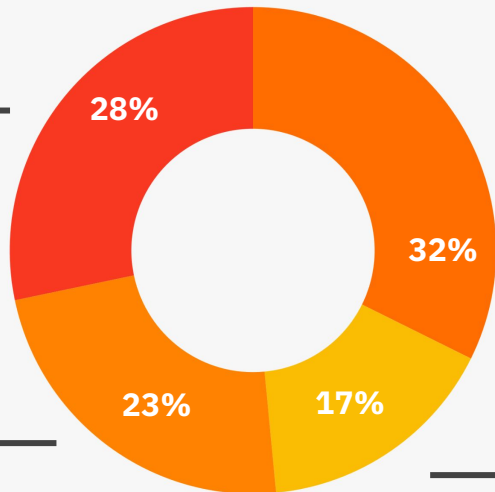

How Camunda changed the game:

British Telecom processes 5x more orders every week with a 20% reduction in costs and a 20% increase in NPS score after replacing a complex and limiting homegrown process automation system with Camunda.

Building a centralized process automation platform

Replacing homegrown workflow technology

Moving to the cloud, modernizing applications, and other initiatives

Replacing a legacy BPMS

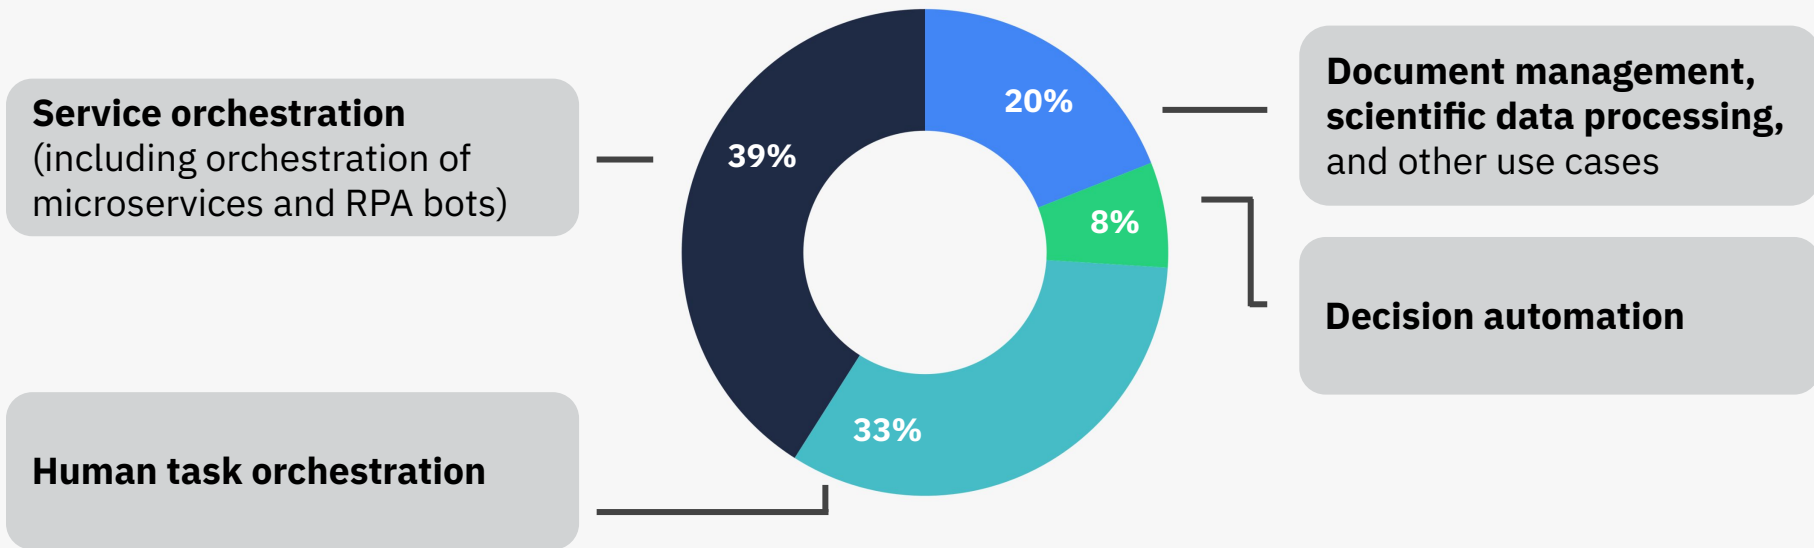

Survey of customer projects, n = 864

Technical use cases

Orchestrate complex business processes across people, systems, and devices

How Camunda changed the game:

Barclays replaced a legacy platform with microservices orchestrated by Camunda and now processes tens of millions of transactions daily while ensuring compliance with international banking regulations.

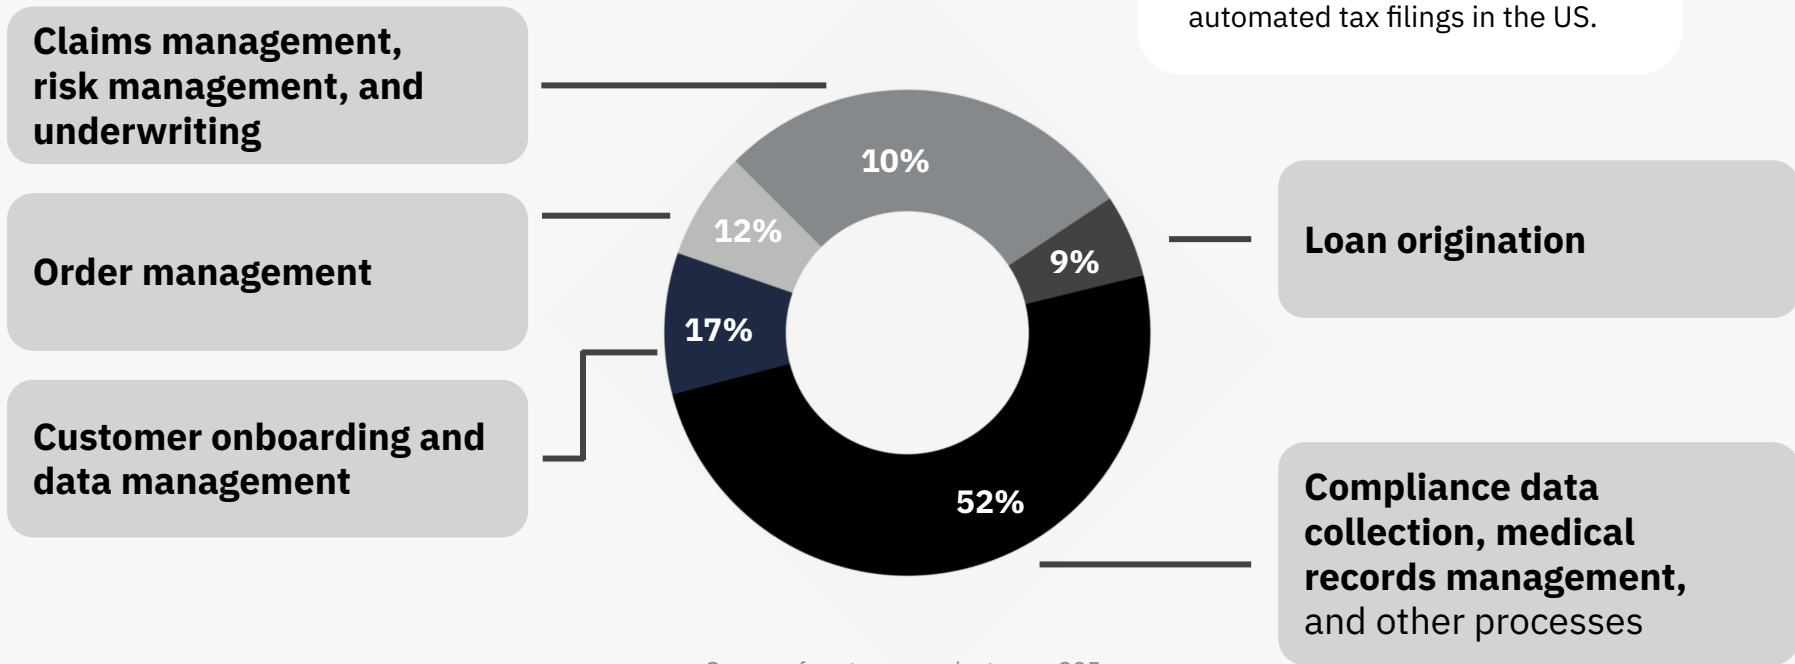

Survey of customer projects, n = 875

Business processes

Across industries and functional groups,
Camunda makes work happen

How Camunda changed the game:

Intuit has implemented 70+ Camunda-powered offerings for QuickBooks and TurboTax customers — including high-volume notifications, complex approval workflows, and automated tax filings in the US.

Survey of customer projects, n = 895

Miscellaneous slides

Traditional approach

Camunda approach

Fragmented processes

End-to-end orchestration

Proprietary tooling

Standards-based collaboration

Hard to install & extend

Developer-friendly

Black-box monoliths

Open architecture

Endless expense & maintenance

Cost-effective

Composability at Camunda

Not composable

Camunda composability

Software delivery lens

Requires you to use proprietary source control, testing, deployment, and/or monitoring capabilities. Doesn't work with commonly used DevOps practices or CI/CD tooling.

Works with enterprise source control, automated testing, CI/CD pipelines, system and cluster monitoring, and multiple programming languages.

Integration lens

Users can't customize, extend, or build their own connectors easily. APIs and SDKs are missing, poorly documented, or incomplete. Workflow engine can't be run in a headless setup, limiting options for application architecture.

Connectors can be customized and extended by both low-code and pro-code developers, and an SDK enables creation of custom connectors. Includes well-documented APIs and SDKs in multiple languages. Zeebe can run headless.

Process design lens

Process flow logic (what happens when) and task execution (how it happens) are tightly coupled. Task execution logic is hidden in a black box. Limited support for advanced workflow patterns. Process models can't be ported to another tool.

Uses ISO-standard BPMN to decouple flow logic from task execution for flexibility, reusability, and future-proofing. Task execution logic is visible. BPMN enables all advanced workflow patterns. Supports import/export of process models.

Task automation lens

Requires you to use built-in task automation capabilities such as RPA bots and document processing features. Doesn't support combining multiple RPA tools, IDP services, etc. Limited support for custom coding.

Use ours, use others, or mix-and-match for maximum flexibility across different departments, teams, use cases. Full support for custom code in any programming language. Helps avoid being locked in with specific tools for RPA, IDP, and other tasks.

AI/ML lens

Requires you to use built-in or pre-connected AI/ML tools such as text generators. Cannot blend deterministic and non-deterministic process execution logic.

Can orchestrate any AI/ML tool or service through pre-built and custom connectors. Supports blending deterministic and non-deterministic process execution in a single process flow.

What to look for in an advanced workflow engine

Ensure your most complex, mission-critical processes run reliably, every time

Design

Features that allow users to build, test, and deploy process and decision logic.

- Process logic
- Advanced workflow patterns
- Integrated decision logic
- Process and decision versioning
- Process simulation
- Process testing

Runtime

Features that deliver massive scale, resilience, security, and durability.

- Long-running process management
- Scalable, resilient, performant state persistence
- Event/message correlation
- Timers and timeouts
- Payload/data
- Synchronous and asynchronous endpoint integration

Operations

Features that make it easy to install, run, and upgrade the workflow engine.

- Open architecture
- Process instance modification
- Process instance migration
- High availability
- Uptime and upgrades
- Backups
- Auditability

Camunda community engagement

Camunda Chapters and Meetups

Program to help community members establish and maintain Camunda Chapters that hold regular meetups

Camunda Online Forum

Community forum for users to ask questions, troubleshoot issues, and share best practices and lessons learned

CamundaCon Europe and North America

Annual conferences for developers, enterprise architects, business technologists, and more

Camunda Local Events

In-person and events for Camunda users, partners, and open source contributors to connect with one another

Camunda Community Hub

GitHub organization for open source Connectors and extensions contributed by community members

Camunda Champion Program

Year-long program that recognizes our most passionate community members and contributors

Camunda Educational License Program

Enterprise license for educational institutions for the purpose of teaching or academic research

Camunda for Common Good

Special software license and support for NGOs and nonprofits that can benefit from process orchestration

Change log

Date	Change	Date	Change
3 March 2025	Added “Roadmap to operationalizing AI” slides		
7 March 2025	Updated the product slide (#9) with more AI focus and AI Agents under Modeler, also new look.		
11 March 2025	Added IDP infrastructure diagram		
3 April 2025	Replaced the “platform stack” slide with a new version using the new Camunda AI symbol and colors; added two slides about agentic orchestration		
16 April 2025	Removed the Camunda SaaS Starter Edition (SaaS is now only available in Free and Enterprise Editions)		
6 May 2025	Added one new slide about how Camunda delivers agentic orchestration		

Process Orchestration & Automation Platform

Design & Implement

Developers & business users collaborate to design processes, decisions, and forms.

Modeler

Design BPMN process models and DMN decision tables, assisted by with AI Copilots.

Integrated AI Agents

Model, deploy & manage AI agents alongside process models.

Forms

Drag & drop UI builder to capture data and guide user interactions across your processes.

IDP

Ingest, digitize, & process documents with AI to increase productivity and improve experiences.

RPA

Integrated RPA helps bridge the gap between legacy & AI for applications lacking API connectivity.

Connectors & Marketplace

Integrate and operationalize connectivity all systems and LLMs.

Test & Deploy

Developers & testers ensure the end-to-end process is working as intended.

Rapid Process Testing

Simulate processes without affecting production systems and deploy with confidence.

CI/CD Integration

Accelerate time-to-market by integrating with your SDLC ecosystem.

Automate

Enterprise-grade automation. Built for today's business complexity, loved by developers.

Zeebe Workflow & Decision Engine

Cloud-native event streaming for unparalleled scale and resilience.

Workers

AI agents, connectors, RPA, document handling, IDP, and custom workers.

Operate

Manage and troubleshoot processes with one model for management.

Tasklist

Web app for tasks that must be handled by knowledge workers.

Improve

Teams have the insights to fix the highest ROI problems for business processes.

Optimize

Monitor KPIs and analyze performance with one model for visualization.

Manage

End-to-end governance of your Camunda installation.

Console

Manage clusters and API keys, review audit logs, and perform one-click upgrades.

Identity

Manage applications, APIs, users, and roles.

Enterprise SSO

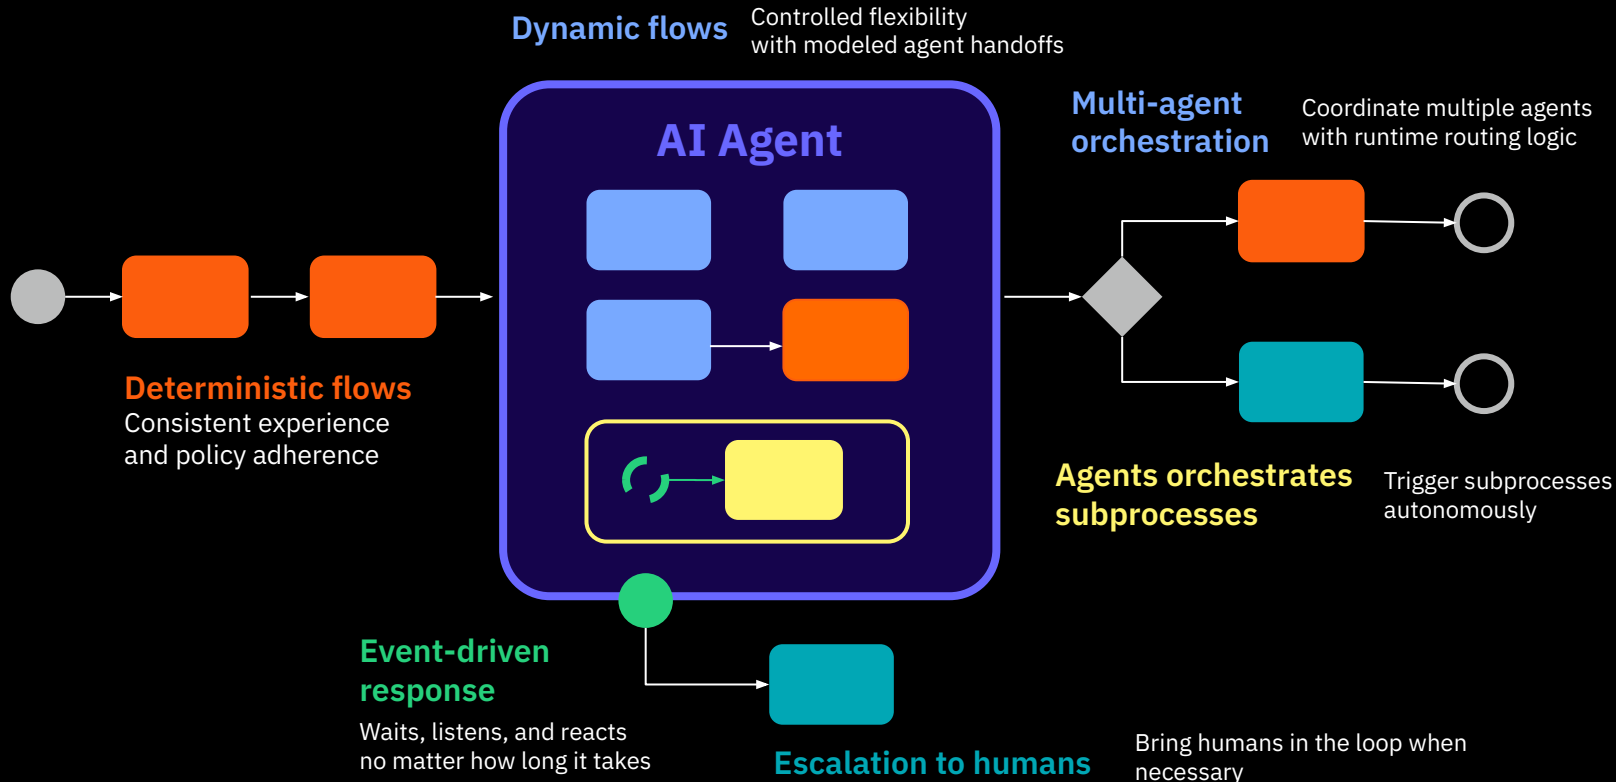

Enterprise single sign-on for consistent authentication and secure user access across your entire organization.

Extend

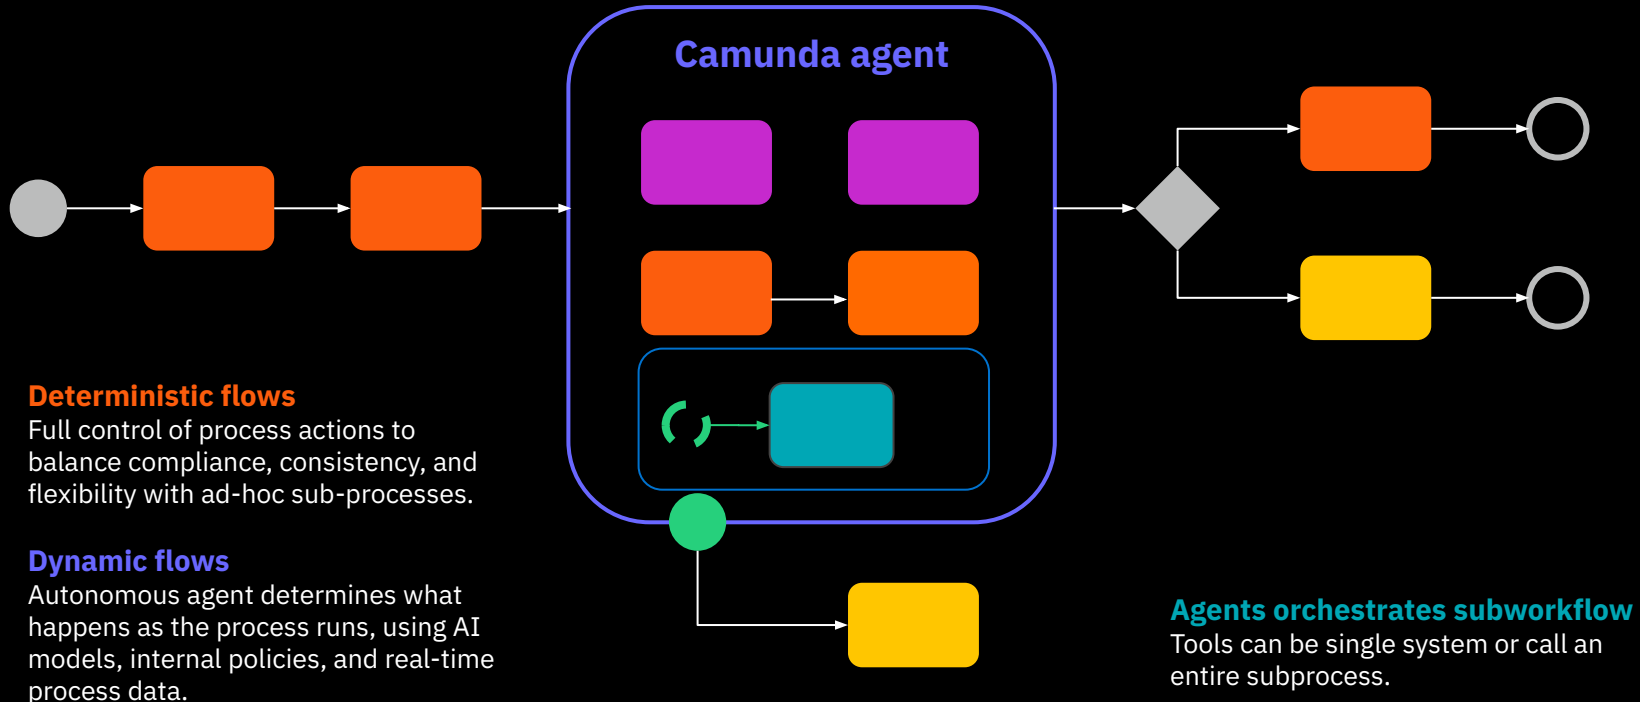

Complete library of SDKs and APIs to integrate and extend process applications.

From idea to production with total control

Executable BPMN. Event-driven runtime. Built-in transparency.

Mixing Agents with Workflow patterns

Multi-Agent Orchestration

Agents orchestrate other agents for streamlined, scalable solutions.

Drive automation with agentic process orchestration

Blend deterministic and non-deterministic (agent-powered) orchestration to ensure guardrails are in place
